After a month of use this way, all is working well. I am going to modify my controller box with some monetary button switches to tap the antenna up or down a bit. I use the tune mode (the FT-100 still thinks the antenna is tuning automatically) while running the antenna up or down. I am happy with it this way. I am sure that Yaesu, my dealer and others do not approve. I have voided any remaining warrantee on the antenna.

The FT-100 is great. I wanted a small radio, with lots of receive coverage, HF and VHF together in one package. The 70cm was just a plus, as I have ever worked 440 before. I had been running a Radio Shack combination of a 2M and 10M radios stacked on the CB. It was difficult to operate and required antenna changes to use the 10M. I used the installed CB antennas. Now I have a neat package with the two radios, CB and FT-100. I can run HF and switch to VHF with no hassle. Dimming the display is too complicated, I wish I could select a channel using the mike buttons and I would like to have lighted front panel buttons, I am still getting used to the menus and using all the features.

That is about it. I can often be found on 20 meters rolling down the road. When 15 or 10 are opened, I will probably be there. I have worked Europe while rolling through Dallas on I35E, had many good QSOs on HF and VHF. I also use the radio to scan outside the Ham bands. I enjoy listening to other services. I have the NOAA weather channels available. For what I wanted the radio does about everything. I can even monitor channel 19 on the CB while off on another channel talking.

Thanks for reading. 73's to all and hope to catch you on the air.

I went to AES today and got the FT100. They said that the 2.4 filter is discontinued.
I got the other filter. I will pick up radio on Tues.
Got the Diamond mount and decided to get the Diamond antenna. Saves some $$ and it has folddown feature to make it easy to garage.
Trying to decide where to mount the radio. May need to get the separation kit.
Will try to put it in the dash.
Cant wait to get started.

Gary:
I stand by my statements. "Bug ridden" is not a representation supported by one or two problems, or even a hand full of failed units. I'd venture to say that the rollout of any new piece of equipment from any manufacturer, Ham, commercial or otherwise results in a number of units being returned for a variety of reasons. I admit to having returned both an FT-100 and a IC-706 for warrantee repair, and can probably go through the archives and find a couple dozen others that have gone back. Again, a small number. So, were's the beef? Show me the hundreds of FT-100's that have gone back for multiple problems that aren't being fixed and I'll personally deliver a certificate of authenticity that Yaesu products are "bug ridden".
Oh, by the way, the 20' of coax thing should be obvious to any Ham who's been around for while. If anything it's a possible indication of a sensitivity to antenna problems, but not exactly a testimonial to a failed radio design.

I concur!!!!! Yaesu is standing behind its product. In any manufacturing process, things do no always go as planned. I have a new KW T-2000, about $105,000 MSRP. Since we took delivery in Jan, it has been to the shop several times. Last night for a failed modulator valve in the ABS system....Hmmmmm modulator valve, sounds more like a radio than a truck. We had a five cent resistor go out in the computer system and it shut the truck down. We had a display that failed. All these products are manufactured by big named corporations, Caterpillar, Kenworth, Eaton-Fuller etc. We can spend all our time complaining, or we can get things right, get back on the air and enjoy what we have.

3190. Re: [FT100] Digest Number 388

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-30 03:31:53 UTC
From: Don B. DeCaria
Topic: 3172 Message: 3190

All,
There have obviously been a lot of changes to the FT100 in it's short life, and I certainly am glad to hear of the lemons as well as the successes...but I'd like to see the list be dedicated to providing answers on how to make the most of the rigs we own or are expecting to buy...and I think it's enough to acknowledge that there were initially some growing pains with both the rig and us owners in getting them to meet our expectations.
Not having heard of the kind of failures that were reported in the beginning for quite some time...I think that issue has probably been resolved and we can now concentrate on educating ourselves on how we can get the most from a rig that, quite frankly, does require a bit more experience/knowledge and finesse than the average "full size" base station type of rig. It sure as heck isn't as intuitive or forgiving as my IC-735! That said...
I have a 9E serial number, with ATAS100, since May of '99, both work fine and I enjoy them immensely...but I must admit they are very fussy about grounding and shielding... lots of ferrite beads and snap on chokes have me up on all bands and all modes...including the seemingly mandatory extra length of coax between the tuner and the rig. At home I have a quarter wave zepp on 160 and a quarter wave vertical on 40, and use a tuner. My experience is any length of wire from a window to tree will outperform a mobile antenna. I have quarter wave counterpoises on each band, and they do a great job of keeping rf outside the shack and off my key/mic.
I did put a lab grade Ammeter between my rig and pwr supply, because I was having some signal problems (rf excursions on SSB and CW) as well as display fading when running close to full power...turns out my 20A Astron power supply was really rated for only 16A continuous, surge to 20A, and yes, the FT100 wants it's full share of Amps at high power, even on 2M it draws over 17A. Of course my nominal "20A" supply was choking...I upgraded my power supply to a 25A supply (23A rated continuous), and sig reports are great and the display is fine...yes, this is a rehash of an earlier post, but sounded like this is one that deserves to be repeated. I made a "boot camp" mistake in assuming a 20A supply meant 20A continuous...and to repeat, the FT-100 is a power hog...I'll spare you my chart of pwr consumption vs band, but it varies greatly over the hf bands just how efficiently it converts 12VDC to rf. It does draw 1.2A consistently in receive mode on all bands. So it's not exactly the ideal backpacking/QRP rig I would have to say.
BTW, I use a deep cycle/starting battery for my backup supply, and have found that if my key down voltage stays above 12V, my sig is fine...so I keep track of my voltage rather than the amps when operating off of the battery, and have found that I still generally am able to run 50% power, stay above 12.0V, and put out a "state of the art" signal. Perfectly fine for emergency operating/camping applications as far as I am concerned.
For mobile ops I now use a Diamond trunk lip mount, and it works great on all bands...again I have aggressively "choked" the coax at the antenna as well at the rig lead in, and have ensured the mount was grounded well. The Toyota Camry is well connected, ground wise, between the trunk lid, body, and hood, so I have had to add no additional gnd strapping. I am sure that is one reason the antenna works as well as it does...It does need the counterpoise of the entire car as much as it needs the ground itself, as having been pointed out in other posts.
My feelings are that this rig is not a good "first rig" for a new ham, (unless you are particulary proficient in practical electronics IRT putting so much stuff in such a small

box vis a vis RFI/EMC, or have an elmer who does)...This is a fussy rig...rather like my brother-in-laws XKE he had in the sixties...a dream if you knew what you were doing with it, but probably not a great first car to learn to drive or maintain. But...if you knew what you were doing and didn't mind being challenged, what a thrill!
Bottom line, for a small footprint, fully competitive mobile/portable rig I like it a lot, and would buy it again. But "plug and play" it's not.
My background is that I have been a ham for 34 years, and have been a rf and telecommunications professional for 31years.
Hope I haven't offended anybody, and 73 to all
Don
NF7R/3
PS: I'd have the factory install the filters next time!

Sticking to the FT100, I believe the consensus of the list was 20ft of coax wasn't significantly long in terms of the wavelengths in question.

Since the implication is I am not as smart as any ham, please explain how such a small length of coax (relative to HF) helps the operation. [This coax is not a poor mans balun, not is it long enough to be a matching network.] If this is so obvious, one would expect that Yaesu would state so in the users manual. Maybe there are no smart hams at Yaesu.

Back to the bugs, any good ham could of figured out the CTCSS on the VX5 didn't work. A business decision was made to sells these shady units. When enough complaints occurred, those who cared mailed them back to be modified. [Like duh, if it wasn't a bug, why did Yaesu make a fix.] Those who got them back and felt they still sucked quickly sold the radios. Further, it was not the occasional VX5 that had the CTCSS bug. Every one shipped out was bad.

Remember everyone, if you don't complain, none of these companies will fix the problems.

3192. Atas 100 security?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-30 05:48:59 UTC
From: Bob Parker
Topic: 3192 Message: 3192

I just installed my Atas-100 on the back of my truck, and am so far happy to say that it appears to be working well. So far, no SWR problems, but I was pretty careful to get a good ground.

My question for the group is about security of the Atas-100. I'm a bit uncomfortable with a $300, cool looking antenna that is so easily removed by just unscrewing it. My other antennas are at least on top of the truck, thus a little harder to reach for most. Has anyone done anything to prevent their Atas from being stolen? I'm considering drilling and tapping a hole in the base so I can put a set screw in to at least slow a would-be thief down. The other option is to remove it myself, and stow it when I park.

Any ideas?

Bob. K6RDF

I drive tractor trailer. My ATAS is mounted on the back of the sleeper. If I am somewhere that I will be away from the truck for any length of time, I remove the antenna. It is simple to twist off, and store inside. My concern is that some clown will think it is a super CB antenna. Most truck drivers have no concept of radio communications theory or equipment. This is obvious by the stuff that they buy for their CB's. Anyway, it is easy to remove and that is the best security.

About security of the Atas-100:
Removing the Antenna is a quick fix but I've found out that in doing so, when you put it back on (radio stayed on same freq. and was tuned before removal) Ant. will some times fully retract before you can tune the band you left it on .Takes about min. or so.
Another idea is to use lock tight (red) permanent will not loosen at all, a little will go a long way.
I have 96 Ford Explorer with Atas on hatch back using Comet K-400 very good results with FT 100 and Atas combo few hours ago worked HB2MM (Switzerland) on 20M.
Am enjoying radio and antenna very much!! 73's Steve KE6TRA

3195. Problem with PTT?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-30 13:24:53 UTC
From: JohnGP
Topic: 3195 Message: 3195

Strange problem with my PTT line. Went to transmit and nothing, changed bands, still nothing. Switched off and back on, still nothing. Then I had a brain wave, I fired up the computer and ran a PSK31 program, went into transmit and the rig worked. So I tried the PTT and that now works as well! Anyone had anything like this on their FT-100?

JohnGP

3196. Re: [FT100] Problem with PTT?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-30 14:45:57 UTC
From: Albert Duane Lawson
Topic: 3195 Message: 3196

Just had two add my two cents worth as well. I've had my ticket since 1976, and have owned numerous radios in that time. Icom, Kenwood, Alinco and Yaesu. In the late 80's I bought a Yaesu 757 GXII which would not recieve in the FM mode. After scratching my head for days, looking at the shcematic, and more head scratching, I called Yaesu and asked for a tech. I told him about the problem, and told him I felt it was something simple, but I just can't pin it down. He said get your schematic, and get your voltmeter and let me call you back. He called me back so it was on his dime, not mine. We spent about 30 minutes going over some voltage measurements in and around the FM discriminator. He finally said "replace these two diodes, I'll call you back in 30 minutes". Well that solved the problem. I had purchased the radio used, Yaesu had'nt gotten a dime from me on that radio, but what their tech did by taking time out of his day to help me with a simple problem like that was insure that I would be a Yaesu fan for life. I now by Yaesu and only Yaesu for that very reason.

I recieved my Yaesu FT100 at the end of February and started by setting it up on my bench and just playing with it to learn it's functions. I have a homemade DK3 I'll be using with it in my truck, but I've been taking my time getting the antenna installed in the truck as well as planning how and where I want to mount the radio. In the meantime, my UHF Mitrek that I use for 9600 baud packet has bit the big one. Not having the time to tear into the Mitrek, I looked at the FT100 and decided to press it into packet service and see how it does there. It's been banging away on 9600 baud packet 24/7 for a month now and it's performance is excellent.

The FT100 goes into my truck next month, and I'm sure that it will be a superb mobile rig. And, if I have any problems, I'm certain Yaesu will correct them in a timely matter. You can call this an endorsement if you wish, I prefer to think of it as relating my very positive experience with Yaesu products.

73's

3197. Re: [FT100] New to the group..

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-30 15:32:39 UTC
From: Jeff Uchitjil
Topic: 3157 Message: 3197

I have a difference of opinion on this note. I have run the 706 mkII and currently own a FT-100. My FT-100 is currently remoted in my 1999 Dodge Dakota pickup.

Mine was a early production FT-100 and had to go back for loss of output on HF. My Icom 706 went back for a similar problem when I had it also. During the return I had them upgrade it. When it came back a week and a half later, the problem was fixed, the AM tx was fixed and the intermitent swr problem was gone as well. I has been 10 months since it went back and all has been well.

Advantage even.

As far as performance, my 706 had the DSP board it. The DSP in the FT-100 far outshines the one in the 706, and from what I unserstand they have not made any changes to the DSP in the G unit. Also the NB is one of the best I have seen on the Yaesu, the one in my Icom was barely noticible.

Advantage Yaesu.

As far as the ATAS 100. From what I have seen this is an amazing little antenna. I have made numerous contacts on 40m CW and 10m voice to people who are running them so they must be more than a dummy load. I know people who have paid big money for a full size screwdriver antenna and have trouble with the motor mechanisms and fingers in them. I use a Hustler antenna with mine and have good results.
Icom's version doesn't exist.

Advantage Yeasu.

The only feature from the Icom that I do miss is the ability to use the microphone up down buttons to send cw with. I have to actually carry a key with me mobile now.

The bottom line is to research the two radios and try to get hands on with each. They are very similar in features and overall performance.

Kenwood delivers a better product out the door and then sticks with it until
the end of time. ex. TS-50. Overpriced and outmatched. They were the first
into the small HF arena and then got lost in the fog.
I am interested to see their next offering. Dayton?

Anyone know why I might have swr problems with my atas antenna/ft-100 only on 6 & 10 M while all the other bands seem to tune fine with no swr indicator?

It also might be a problem of RF getting back into the control head.

3202. Yaesu or Icom ?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-04-30 19:19:16 UTC
From: Chris Nelsen
Topic: 3202 Message: 3202

I have owned several of the Yaesu rigs over the past 37 years in ham radio and a few of Icom. My opinion is, there is no comparison. I never had a problem with Yaesu (that was not a simple fix). Never had to send any of them back to the factory (including the Ft-100). The FT-100 has performed exceptionally well as a mobile rig. If you know the difference between a DC ground and a RF ground, the ATAS 100 works great !
Can work Europe, S. America just about every day.

Icom is the opposite ! Every rig I have had from them had problems after a short while, and absolutely no help from the "factory". I only buy Icom stuff at Junk price, that is what it is
worth to me. My dealings with Icom has left a very bitter taste and I don't even look at the new junk they put out.

Well, that is my 2 cents.

First of all, this is really off topic so I'll apologize in advance for
responding to it. I was going to change the topic title, but figure that
anyone who has tuned out due to the off-topic nature of this thread has
already done so.

I communicate daily with 4 hams who use VX5s and they absolutely love them.
I have never heard any of them complain about the CTCSS function. Just as a
reference, 3 of them are real Extras with a combined ham experience of 95
years...so they are 'good' hams. In other words, they are not some clueless
Techs that just fell of the turnip truck. :-)

As for CTCSS, I know that I wouldn't be talking to them at all if the CTCSS
didn't encode properly, since our repeaters have CTCSS (PL tone) squelched
inputs. So I could only assume you're talking about CTCSS decode function.

Most repeaters roll off the audio below 250 Hz, so you're lucky to have your
PL squelch work at all if you're listening on the output of the repeater.
Therefore, it's unusual when repeaters allow the PL decode feature operate
properly. That means that you have to decode on the input of the repeater if
you're trying to figure out the PL input tone. For that to be effective, the
input signal must be of sufficient strength and has to be persistent for a
period of time it takes to decode it properly. Most decode features work
like this: Starting at the bottom range of the CTCSS standard of 67 Hz,
step through all 39 combinations up to 250.3 Hz and see if the signal has
enough subaudible tone strength to exceed some threshold. This takes a while
since the tone is very faint (which it must be to remain subaudible), and
you're using a high-Q digital filter which has some finite settling time. If
the signal goes away during the scanning, it will interrupt the process and
you'll have to start over. Another difficulty is that the input signals to a
repeater are often difficult to receive, hence the need for a repeater in the
first place.

I find the CTCSS decode on my FT50 to be more of an annoyance than it's worth. If the repeater is 'open' the tone should be published. If it is not published, you can just figure it out by experimenting with all 39 possible combinations to see which one opens the repeater. If the repeater is closed, then there's really no point in trying to hack into it anyway.

To impugn the reputation of the VX5 for a seldom-used feature like CTCSS decode is silly, especially in an FT100 forum. Like most other rigs, the FT100 doesn't even have a CTCSS decode function.

I guess you don't understand the problem. The CTCSS on the VX5 when set to the proper tone (i.e. not trying to sleuth a tone) responds very slowly. On a repeater, most people pause to give the repeater time to get in the mood, so delay in the CTCSS response is not much of a problem. In simplex communications, nobody bothers to wait for the repeater to get in the mood 'cause there ain't one, so they key up and start to talk. On the original VX5, the first word would often get chopped off due to the dog slow response time. After Yaesu fixed the problem, you now only loose a syllable once in a while. The real pain is that $50 FRS radios have better than the CTCSS on the VX5. The CTCSS on the FT50 (again, not sleuthing, just set to the right tone) works very well.

Thanks for pointing out that the FT100 doesn't have CTCSS decode. This is something I forgot to check into since I kind of assumed it would have it.

It is true that ICOM knobs, lights and such are truly poorly engineered, which is why I tend to avoid ICOM too. I think they survived on getting the government sales that Watkins Johnson didn't get, but you run into old government/military owned ICOM gear pretty often, but never any of the other Japanese brands.

Topic: 3200 Message: 3216

Mike - Assuming you have not caused the problem by the way you mounted the ATAS there have been some problems. These radios have a problem between the HPA and filter board in the radio. It causes high vswr problems on 10 and 6 meters and sometimes 12M. The best way to fix this problem is returning the radio to Yaesu. If you REALLY want to fix it your self the fix is 2, 3/16 inch wide ground straps from the HPA to LPA board coax connector shells (J5015 and J5014) to ground at the casting web. Yaesu did this to mine and it fixed the problem. (My radio would go into oscilation on 10M and output 13.xxx mhz when the dial said 28.xxx mhz. THAT sure raises VSWR.)
The FT100 and ATAS now work GREAT in my Blazer and i REALLY like it!
The combo did have a minor vswr problem on 6M on my motorhome. It was caused by the lack of a complete vehicle metal shell. A couple of 1 by 4.5 ft pieces of flashing alum. tied to the antenna mount and glued flat on the roof fixed the problem. It now loads good ALL bands 40M to 450 Mhz.

Yes. If you look in the bottom left corner of your screen, you'll likely see GCH. If you wish instead to scan all the groups, push down the select post on the left hand side. I don't have the rig in front of me, and my manual isn't handy, but I'm referring to the knob on the left hand side of the radio. Hold it down for about 2 seconds, and you will hear a beep. It's now in memory channel, rather than group channel mode. Scan from here, and it will scan all 300 memories.

Hi Gary,
the literature states that the 2.4 kHz filter is default in the radio.
I was interested in getting a better, sharper filter. Got in touch with
International Radio who had planned for a 2.1 kHz. But they came back
RECENTLY and told me that they do not find a suitable manufacturer,because
the filter has to be very tiny.
I'll speak to them again during the Dayton Hamvention about this.
Regards
Rainer

From: Paul R. Valko
Topic: 3195 Message: 3224

That could happen if the radio is in "split" mode with the TX band being
out-of-band or mode (CW).

So it MAY be possible that once you connected the radio to the PC, and the
PC set the FT-100 up, it was fine.

Just a thought.

I found it quite useful, in that I learned a lot about the possible problems with the rig, and about the good things as well. It's true you don't get a balanced viewpoint. Those that are unhappy will post often as a measure of their displeasure. However, once I knew who they were, I stopped tallying them as another user who was unhappy, and instead counted them as the same person, still mad/disappointed. The newsgroup was interesting as well, as there were frequent postings about the rig, all citing dire problems, a massive failure rate, and the like. The thing was that they were all posted by the same person (dlr18sh), and he didn't own one, and they constantly mis-stated the contents of this mail reflector. Having realized that, I ignored anything he posted, and made my own decision by reviewing the comments in this mail reflector.
Anyway, I guess the point is that I found that I learned a lot about the rig from here, but found that I had to read critically, and not accord too much weight to the same persons who post 200 times about the same problem.

Duh! What is the point of coming to a mailing list for a particular rig to get the information you require. Do you really think you are going to get a balanced point of view about the gear, I don't think so.

Hi All,

Just a quick thought....

Most any antenna suffers from how we mount them on a vehicle!
Then need a "good" ground which often isn't there.

Having to bond car parts togeather or figure out how to get
a non metal RV to act like it is metal has nothing to do with
any brand of radio or antenna!

Just think about how you have to retune each antenna when they
are moved from one vehicle to another. (OK, some might work
on more then one without retuning, but most of the time that's
not the case).

I think the ATAS 100 does a good job if it's given a good
ground to work with.

So I'd suggest that you really make sure it's a real Yaesu
problem before comdeming it! :-)

I have had no problems with my FT 100. But I did send the
ATAS 100 in for repair once. It would not move up or down.
The tech at Yaesu called and said that he could not find
anything wrong with it.

They sent it back and it's been working fine since!

Mine is mounted on the ladder at the back of my fiberglass
RV and I need to provide a better ground.

Both the ATAS 100 and a new High Sierra Screwdriver act
the same. Can't blame either one for my lack of ground. Adding
a little coax MIGHT also solve the problem. Don't forget
that the little piece of coax running from the radio to
the antenna is really more than just a wire!

One interesting thing to do is put a 2m rig into a SWR
meter that is connected to several feet of coax that is
open on the far end.

Now look at the swr and trim the coax until you get a
good 1:1 match WITHOUT any antenna.

The raw math and theroy gets over my head but this example
helps me to see that adding some feedline just might make
something happen!

Enjoying my FT 100 and ATAS 100 here in NV. (And NO, it does NOT compair to my FT 1000MP and Force12 at 85' that I gave up to go full time RVing!)

:-)

Hope this helps someone....

For those on the list who have an installation in a hatchback, where did you bring the coax in to the car? Having never done a mobile installation before it looks to me to be too tight on my FourRunner to bring it in through the hatch without severely crimping it.
Any ideas would be appreciated.

Good Day:
Use Comet K-400 mount. The cable going to mount is very tiny (small as 14 AWG wire) then adapts to mini 8x then to pl-259.
I have 96 Explorer with Atas on driver's side hatch back It works very well.
Will you be using the Atas?
If not, I believe Comet makes 3/8's mount that is similar. 73's Steve KE6TRA

Look around under the whatever carpeting you may have back there. I have a Saturn SC2 and found a nice grommet for the coax to go out under the car and to the antenna (mounted on a homebrew trailer hitch stud). A little RTV and it works like a champ.

Otherwise, do what I did in my previous car: drill a hole through the bottom/floor in the spare tire well. Again, seal it with RTV and you should be fine.

>Further investigation found the base of the antenna was full of water.

Thanks, George, for the interesting report on the ATAS experience. Can you fill us in on how the mount and base might have got so waterlogged? Were there signs that it worked itself in under the boot?

I also have had wetness in the ATAS100, but I was pretty sure it was because of me. In fooling around with mounting methods, I stumbled across the fact that some additional capacitance across the matching network could drop the minimum swr on 40 from 1.6 to 1.1. So for a while, I used one of the screws under the bottom rubber shield as a place to hook a capacitor. Seemed like a good idea at the time, but I now realize that even with the rubber in place, this violated the seal around the stalk, what with capillary action etc.

I got suspicious when the motor wouldn't move below 32F, and I finally took it apart a few weeks ago. There were water droplets visible right on the motor and a fair amount of corrosion all around. The corrosion pattern suggested that the water came in from the tampered area. The cleanup went mostly ok, except I ended up with a solder bridge across the motor connector, and that took out the MB3763 motor driver IC. Yaesu parts didn't immediately recognize the IC by that number, but they faxed me the whole ATAS100 parts list, and within a few minutes it was identified and the replacement was on the way. It's back together with some RTV for insurance, and working great again.

I recall some comments on the list about the ATAS100 not working in the cold, followed by others who said it works fine. If it's due to a little water, freezing may be the first noticeable problem, but corrosion could be a longer-term worry.

So I'd be interested in other experiences with water getting into an intact ATAS100.

73 to all,
Ed, K1GGI

And at the wrong length the energy is reflected back to the radio. Kind of like the old war protest days when they would break the antenna off a police car and then the radio would fry when it was keyed up. No thanks.

Yep, no antenna or dummy load.

I first saw this in Idaho when one of the sheriff departments
couldn't "get out" with their base station.

The radio was fine and the SWR was nil. Good 1:1 match.

The coax had a splice in it using PL259's and a barrel
connector. That had come unscrewed and all that was connected
to the transmitter was about 150' of coax.

Since then I have see it done as a demonstration.

A simple piece of coax can really be a rather complex
circuit!

3237. How to interpret SWR display ? (2nd posting)

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-02 18:25:08 UTC
From: Tim G4WIM
Topic: 3237 Message: 3237

Hi,

I'm new to this list and the FT-100. I have a question about how to interpret the SWR display. I suspect the top line shows fwd power and
the lower line shows reverse power. Thus a 1:1 match should result in fsd of top line and nothing for the lower.

I've checked the archives and FAQ but not found any info on this topic.

I posted this message earlier today - but it didn't show up, probably something I did wrong ;)

Any help would be appreciated.

Thanks

Tim

The little bars on the bottom show relative SWR. More bars means higher SWR.
I have observed that about 4-5 bars is roughly 2:1.

3239. Normal -high-Normal SWR

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-02 18:44:24 UTC
From: Jay
Topic: 3237 Message: 3239

Hello all,
I have been watching this list for a while, and now it seems that I might have to ask a question to see if what I ma experiencing is similar to others out there.

What I seem to have now (after owning the FT-100 for about 2 weeks) is an intermittent SWR problem on 2 meters as well as 10 meters. (I might have it on 6 meters but I do not have an antenna to test it.)

Now it seems that I can be yapping away, and everything is fine, then all of a sudden the high SWR icon lights up. If I turn the rig on and off, it does not matter, the high SWR still remains when I transmit. If I wait for a few minutes, the normal conditions return and everything is happen again! I can then continue on talking for several minutes without incident. (Although I have not talked long enough to see if I could force it back to display the high SWR again)

I DO notice I signal degradation when the radio goes into this high SWR state, very strange. When it "disappears" I notice that signals are back to where they were before.

Strange!!!!

Has anyone experienced this? normal SWR -- High SWR -- wait a min or two -- Normal SWR?

I am not one to open up the radio and do mods myself, so I am thinking that it would get sent back to Yaesu if that is in fact needed.

3240. Abnormal SWR Icon on 6, 10 & 12 Meters Solved (info for others)

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-02 23:44:26 UTC
From: Jeff Sherman
Topic: 3240 Message: 3240

Been noticing several comments on the list of similar problem I had.
Here is a copy of a posting I made awhile back:

" I was able to identify, located and fix the problem. (I noticed
that the oscillation disappears (internal oscillation which causes
6
thru 12 meter SWR Icon and power shut down)when the filter board
side
cover was removed . There needs to be thick grounding straps added on
the ground shell of the J5014 and J5014 connectors to the chassis
ground on the LPF Filter board of the radio. The straps need to be as
short as possible and as thick as possible (I used 2/16 inch
solderwick).The straps need to be attached right at the "Rib" (the
section cavity wall)near the connector shells (ground shell of the
plug in connectors). The radio already had a grounding strap on
J5015
but it used a metal strip that was probably too long (too much
inductance to ground , Acouple of NH's does make a difference !!!) .
The copper tape that was used probably was losing contact to the rib
thus losing a good contact to ground. If the radio is under warrenty,
it is highly adviseable to have Yaesu do this fix as the circuitry in
this radio is extremely delicate and can be damaged easily. I work
with RF Circuit Design for a living so I personally was able to fix
it
myself.

The transmit section of the radio looks into the LPF filter board
before it goes to the antenna outputs.The mini coax connectors that
feeds these two sections need to be terminated with the proper loads
between each section. If the grounding is bad on the filter board
side, the transmit section sees a bad SWR which is probably causing
the oscillation."

The problem i had before was a SWR Icon and no power output on 6/10
and 12 Meters. With this fix, all the problems are gone.

>

Tim,

I would take what Yaesu says about the power level meter and the SWR meter literally:

The power level meter displays the power output as a percentage of the maximum allowable power on that band.

The SWR meter displays the relative SWR.

While an elevated SWR will likely reduce the amount of power output of the radio, reading the power out at SWR levels greater than 1:1 as a true measure of percentage of full forward power output at 1:1 may not be accurate.

Don't forget that power output is adjustable. You could be at 50 percent of allowable power output and and read an SWR of 1:1.

The power meter on the front shows RF watts. The numbers under the meter are power in watts. You may be thinking of the output power setting control in the menus. Its setting is a percentage of full power on the band.

I've seen several different takes on the SWR meter issue. Based upon using my FT-100 with several different external SWR meters, including the ones built into my amp and my antenna tuner, and comparing them to the reading on the FT-100:

1. I believe the SWR meter is a relative, not absolute read-out. Thus, the reading is the same regardless of what power you're running.
When I was first establishing my antenna tuner settings with my long wire, I started at low power then tweaked the settings at higher power. SWR reading on the FT-100 was the same. And you can get the "high SWR" indicator at low power.

2. Based upon direct comparisons of external meters and the FT-100 (I'm going a little bit on memory), 1 bar is about 1.1-1.2:1. 2 bars is about 1.3:1. 3 bars is about 1.4-1.5:1. Most importantly, up to 3 bars is a very satisfactory SWR.

If you have, or can borrow, an external SWR meter, it's very useful to do your own comparison.

3246. Re: [FT100] SWR problems

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-03 16:46:13 UTC
From: Mark Schroder
Topic: 3200 Message: 3246

This is interesting!! And it could very well be the cause of many of the SWR problems with the FT-100. I have always known that the length of coax feeding an antenna can affect the performance of the antenna, but have never looked into it. I put a piece of RG-8x (53'-9") on my HP Network analyzer (I test PCS, Cellular and Paging antenna systems) and ran a sweep from 300kHz to 3GHz. The open ended coax is <2:1 from 300-1295MHz with the best reading (1.081:1) at 810MHz. I ran a sweep on a piece of 1 5/8" coax (~135') and the best I got was about 5:1 at 3GHz. I have a feeling that cable loss has a lot to do with it as the 1 5/8" cable exhibits .225dB of loss and the RG-8x exhibits 3.3dB both per 100ft at 100MHz. I am going to investigate farther and try to find the theory to back it up.

I have found some variation in the SWR my FT-100 likes to see depending on the frequency. On the 40 meter band I found that I could Tx on 7.180 with a VSWR of 1.4:1 and 7.235 with a VSWR of 1.8:1. The antenna was tuned with a center frequency of 7.198. Any lower than 7.180 or higher than 7.235 and I got the High SWR light. Incedently I have the FT-100 mounted in my truck running into Hamsticks without a tuner. I have gone to no great lengths to ground the radio and have the hamsticks installed on a homemade trailer hitch mount. I do have a fairly long run of coax between the radio and the antenna and this may be why I am having no problems with getting a good match. Using the Hamsticks and the Hamstick matching coil I have the above stated 55 kHz on 40 meters and the entire phone bands on 20, 17 & 15.

Just a few observations about SWR and how it relates to cable length:

1. Antennas are tuned at the factory to meet certain specifications, usually <1.5:1 or a return loss of -14dB in a certain frequency range.

2. As you increase the length of coax attached to the antenna the SWR improves because the coax is absorbing some of the rf energy. You add two times the cable loss to the antenna specification to determine if the antenna is performing properly at the end of the coax. If you have a -14dB (1.5:1) antenna and a cable with 3dB of loss you would want to see a return loss of at least -20dB or an SWR of 1.2:1.

Just because you have a good match (<1.5:1) with your antenna attached to the coax doesn't mean that any radio is going to like it. I have found that the FT-100 has an extremely sensitive receiver and that sensitivity may be the problem with short runs of coax when mounted in vehicles. This is why manufacturers tell you not to shorten the supplied cable on mobile mounts. Take a look at the last chapter of the Extra Class Manual for the relationship between coax length and Inductive/Capacitive Reactance and voltage and current standing waves or chapter 19 in the ARRL Handbook for excellent detailed discussions on transmission lines.

I will be posting some plots and pictures on a sub page of my web site
www.sweeptest.com/amateur tonight.

Topic: 3200 Message: 3247

re: cable length

Loss is not much of a factor in changing the situation when you're only talking about 20' at these frequencies. I think what's happening is that changing the length of the cable is moving the position of the voltage and current nodes on the cable when an imperfect antenna is being used. Knowing that some FT-100's have an issue with shielding that causes them to read excessive SWR, the position of the voltage or current node at the radio can possibly exaserbate the problem. Changing the cable length is probably just moving those nodes so that they have less effect on the radio.
This is also true with any RF that's riding in on the outside of the cable due to antenna grounding, decoupling and cable routing problems since there are definatly going to be standing waves on that as well. Again, the length of the cable would affect the level of RF at the radio and therefore changing it may avoid the problem.
In any case, changing the cable length doesn't really fix what's causing the problem, but it apparently does make things work for a number of people.

I can recall working folks using the PTC-II who were using the FT-100 via the data cable. Should be absolutely no trouble, although I haven't tried it myself (using my PTC-II with my 1KMP). The FT-100 offers a better rig for using the PTC-II than many others because it allows use of the narrow filters in data mode. Its designers had AFSK modes such as PSK31 and Pactor 2 in mind. RJB.

Topic: 3251 Message: 3251

Hello,

New to the FT100 and this group, would anyone know why my 100 has created an "extra" Ham band ??

Between 18 and 21mhz is a 20mhz "allocation" that I cannot remove. The rig has not been modded in any way. I sometimes have two extra bands at 17 and 20mhz and they come and go as they please !!

Any ideas ?

Otherwise an incredible piece of miniaturization.

I sent my 100 priority mail on Tuesday afternoon, they had it on Thursday morning, it was shipped back Tuesday afternoon. It went in for no power out/ high swr 440/2/6. They replaced an IC, a couple of diodes, and realigned the rig to factory specs. It was only 3 months old but I assume that the realingment was necessary due to the new parts.

3254. Re: [FT100] Band extras

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-05 12:37:08 UTC
From: Mark Schroder
Topic: 3254 Message: 3254

I hadn't noticed the second one, but too have two extra bands that I can scroll through. When I press the UP button I have always had one at 80 MHz and the other day I got in a traffic jam and tuned to 27.185 to see if the truckers were talking about it. Now on VFO A 27.185 is there between 12 & 10 meters and I still have 80 MHz and on VFO B the two bands are at 17.999MHz and 80MHZ (I just haven't moved the on at 80MHz). I sent my radio back to Yaesu for a Warranty repair and they said they installed all current production mods and re-aligned it, so whatever it is it must be something that they built into the rig and don't mention in the manual.

I kind of like having the extra band steps. My FT-890 allows me to switch from GENeral to HAM coverage which changes the frequency using the UP and DOWN buttons to 100 kHz and 1 MHz (FAST) steps. Seems like an unpublished feature.

I've noticed this band accumulating feature on the FT100. Once I accidentally tuned outside the 12 m band to a frequency of 25.010 Mhz which 'added' an extra non-amateur band. I wasn't paying attention and switched bands using the up/down keys when it was in that state. Then that band became a nuisance since I didn't want to tune to it. I don't know exactly how I got rid of it...I think maybe I did a reset. I recently listened in on a NOAA broadcast at 165.400 Mhz and now that band is in the up/down list too. I didn't see any mention in the manual of how the up/down band list is supposed to work or any way to eliminate a band from there. Anyone know how to add and delete bands from the up/down scroll?

I was just a little confused when I read this posting. I think you meant to write ARTS, not APRS. I have 4 Yaesu radios with the ARTS (Auto Range Transpond System) feature and have never used it. Your message left me so intrigued that I just had to try it. Here are the instructions for other to try it as well:

Go to menu item 11 and enter a CW ID string with some W's in it. To do this, press SELECT knob and use the main dial to select the characters. Press the select knob to advance one character. Press the FUNC key to finish.

Go to menu item 10 and enable the CW id during ARTS operation.

Set the radio to a clear simplex FM frequency.

Press the FUNC key until you get to screen 3 which shows TON DCS and ART. Enable ART.

Listen on another radio. The DCS code will be sent every 15 seconds and the CW ID will occur every 10 minutes. Use a tape recorder, as the ID comes across at about 35-40 wpm. I have a little recorder that will allow me to record at 2.4 cm/sec and play back at 1.2 cm/sec so I can listen to the CW at a more comfortable 18-20 wpm.

RESULT: U and W are sent exactly the same way! di di dah!

My radio is a 9I serial number purchased in December 1999.

3258. Re: [FT100] Abnormal SWR Icon on 6, 10 & 12 Meters Solved (info

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-06 04:20:21 UTC
From: Philip Snyder
Topic: 3252 Message: 3258

For those who asked, my serial number is 9E031358. Now I seem to have another problem. As I am mainly using the rig on 6 meters at the moment it is the only place this had happened. I turn on the rig and all seems fine. I hear that 6 is open and when I key up I get the high swr icon, but what appears to be full power (then run to mobile to work opening.) Come back inside to check out rig and all is well. This has happened a couple of times. After a few seconds it goes away and doesn't come back until the next time I use the rig. Picked up a dummy load tonight and will do more investigating. Is this similar to the recently mentioned swr problems? I seem to remember that they came and went. Not just when rig first turned on. Thanks

Phil Snyder

From: Gary Mitchelson
Topic: 3254 Message: 3259

There is one extra band on the HF-6M side and one on the V/UHF side.

unpublished
> feature.

I've noticed this band accumulating feature on the FT100. Once I
accidentally tuned outside the 12 m band to a frequency of 25.010 Mhz
which
'added' an extra non-amateur band. I wasn't paying attention and
switched
bands using the up/down keys when it was in that state. Then that band
became a nuisance since I didn't want to tune to it. I don't know exactly
how
I got rid of it...I think maybe I did a reset. I recently listened in on
a
NOAA broadcast at 165.400 Mhz and now that band is in the up/down list
too.
I didn't see any mention in the manual of how the up/down band list is
supposed to work or any way to eliminate a band from there. Anyone know
how
to add and delete bands from the up/down scroll?

>"U".
>> Yaesu

Yes, Lee, I did mean ARTS. And you can tell the defect immediately when programming the ID, you don't really need to prove it in actual use.

Wow, they do seem to send a "U" when you ask for a "W". Strange

Dare I ask ??!!

How much is the FT100 in the States ?

Here in the UK I have just paid a "discounted" 1280 US dollars equivalent, reduced from 1990 USD !!

This was for new on the assumption that a newer model is about to be released. The Kenwood TS50 is now 760 USD but mine cost 1600 USD about four years ago.

Any comment ????

Ya can't trust salesmen. When I bought mine for $1100, I was told that the price was going up after current stock was depleted. That was in Feb and they said that they only had 3 left.

Does the rig in the UK come with any of the additional filters or temp stable oscillator for that $1280 price?

Great rig though isn't it?

Hell !!

I send an email about the relative cost of an FT100 and in SEVEN minutes I have two replies !!!!

How do you guys do it ??

OK I know you have free access so can be online 24 hours but in our Blair ridden "rip off" country you can wait days for a response.

Well done all. This call has cost me 8 cents for 15 seconds online.

3274. Testing the CW ID

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-07 05:07:39 UTC
From: lee810@aol.com
Topic: 3274 Message: 3274

OK, I wasn't overwhelmed by responses to my last set of instructions on testing the CW ID so here is a MUCH easier way to conduct the test to see if on your radio the 'W' is sent as a 'U':

Press the FUNC key and go to menu item 11 and enter an 8 character string with some W's in it. Alternating U's and W's help in this test. To do this, press Select knob and use the main dial to select the characters. Press the Select knob to advance each character. Program all 8 characters. When you get all 8 programmed, press Select again and the radio will playback the ID you've stored. You can try this a few times and you will be able to tell if you have the problem.

3275. FT100 SWR.

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-07 09:21:33 UTC
From: Andrew Walker
Topic: 3275 Message: 3275

How about this one ?

My rig. into a dummy load on 24mHz and 28mHz outputs about 4 watts on SSB as soon as the mic button is pressed and before I open my mouth ! External power/swr meter in line.

On an antenna the output rises to 10 watts with an SWR of 3:1 (mouth still shut). Speak and the SWR icon appears, the output rises to 25 watts with same SWR. (Power out set to max.)

This is not the case in CW key up mode or any other band.

Is the PA going unstable and if so why ?

Andrew G3OUT

3280. CW id Problem, confirmed

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-07 23:12:08 UTC
From: Keith
Topic: 3280 Message: 3280

I programmed Ws and Us, they all play back U (dit dit dah)!!!!
Has any one checked all the other letters?
Is there a way to set the speed? Menus 47,48 and 52 have no affect.
(Serial No 9F041xxx, never been back to the factory).....Keith WE6R
My webpage; Six Meter Repeater list and a BUNCH of interesting links;
http://www.angelfire.com/ca3/we6r

RE; Subject: Testing the CW ID

>OK, I wasn't overwhelmed by responses to my last set of instructions on
>testing the CW ID so here is a MUCH easier way to conduct the test to see if
>on your radio the 'W' is sent as a 'U':

>Press the FUNC key and go to menu item 11 and enter an 8 character string
>with some W's in it. Alternating U's and W's help in this test. To do this,
>press Select knob and use the main dial to select the characters. Press the
>Select knob to advance each character. Program all 8 characters. When you get
>all 8 programmed, press Select again and the radio will playback the ID
>you've stored. You can try this a few times and you will be able to tell if
>you have the problem.

3283. FT-100/ATAS-100 in Mercedes 190E de KA6K

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-09 14:55:59 UTC
From: tomellett@aol.com
Topic: 3283 Message: 3283

Hi Gang:

Got my new FT-100 & ATAS-100 working great! With lots of help from the OneList.com group, I was able to create an effective counterpoise for the ATAS-100 and I can tune up with a low SWR on all bands 7.0 - 440MHz. Took care of my ignition noise too! I've also posted a link to my page on the OneList "files" list.

==> http:members.aol.com/tomellett/ka6k/page4.htm/

Thanks Again for all the help!

Best 73's to all de KA6K - Tom

PS: Any comments or corrections to my page is always appreciated.

Sounds like putting something together for dayton Hamvention is'nt going well. I will be in the fleamarket at 2505, We could get together there around 12:00pm 5-20-00 and then migrate to a location where we could talk. Three of our group are FT-100 owners. Drop by and say Hi any time during the Hamvention. If we aren't there we are walking the fleamaaket. Hope to see you at Dayton!

From: emoxon@alum.mit.edu
Topic: 3286 Message: 3291

Convening at 2505 at noon on Sat. is a fine idea, I will sure drop by.

Also, I will park at the remote end of Salem Mall and hang around toward the end of the day Fri. and Sat. Look for an ATAS-100 on the roof of the Jeep. If anybody wants to form a group for the banquet on Sat., we could do it there and then, or even better would be to see here on the list if there's any interest.
(BTW, it looks like I'm going to end up with an extra banquet ticket -- let me know if there are any takers).

Coordinating via some simplex freq may be worth a try. I got a very practical remark from Mike AA8JI --
>There is so much interference from all the RF that finding a useable freq.
>will be
>hard. 6 M is hardly used here...there is a new repeater that not too many
>know about
>located at Hara Arena 52.030.
> ...
>Mike AA8JI

I will suggest also trying 146.955 simplex, just 'cuz it's my club's frequency and I got out the directory and it looks like repeaters around Dayton are a fair distance away. I may be wrong, and any other ideas would be welcome.

See a bunch of you soon, hopefully.
Ed, K1GGI

The easiest way to mount your radio and antenna is to trade your mini van in for a new pick up truck, preferably a big 4 door dually. More ground plane with the big truck. Make sure it is diesel, (less ignition noise). Buy an aluminum ladder rack and drill a hole in it for the ATAS. This will guarantee a good ground. Run the shortest run possible of the best coax you can afford. Mount the radio underneath the seat and add a big braided ground strap that is no longer than 3 inches. Install the separation kit. Throw away the power cord that came with the radio. Find your old jumper cables and cut off the ends and use the jumper cables as your power cables for the radio. Now you are ready to transmit. Go to 40 meters and hit the tune button for the ATAS. Good, the radio says you have a good SWR. Find someone to talk too and get your signal report so you can brag about your new radio. Do the same thing for each band working your way up to six meters. You may not find somebody to talk to on six meters, (this is normal). Wait a minute, when you get to 10 meters (fill in your own band) the radio says that you have a good SWR, but when you talk the SWR icon comes on. What's the deal? Don't bother rechecking your installation, you did nothing wrong. Go back to the candy store and buy 1 barrel connector for your coax and a couple of pl259 connectors. Now simply add 2 extra feet of coax (fill in your length) to your original coax with the barrel connector. Rerunning a longer piece of coax wont work, so don't try it. You have to add to your original coax. Don't ask me why, Yaesu doesn't even know why. For some strange reason adding a couple of feet to your coax fixes the high SWR problem. Now you are all done. Enjoy your new radio. I love mine.

Andersen powerpoles have become the defacto standard for many installations.
If you put one your power source, then just put them on all your radios and
they are sure to work all the time.

Yeah... 'cause lets say that only one ham in a hundred is a creep... and of those, only about 1000 may actually pass his vehicle that day... that means there would be 10 guys that may want to lift that antenna and sell it in the flea market.

Too bad... mine will not be left in the car (neither will the rig!)

Wait a minute, when you get to 10 meters (fill in your own band) the radio says that you have a good SWR, but when you talk the SWR icon comes on. What's the deal? Don't bother rechecking your installation, you did nothing wrong. Go back to the candy store and buy 1 barrel connector for your coax and a couple of pl259 connectors. Now simply add 2 extra feet of coax (fill in your length) to your original coax with the barrel connector. Rerunning a longer piece of coax wont work, so don't try it. You have to add to your original coax. Don't ask me why, Yaesu doesn't even know why. For some strange reason adding a couple of feet to your coax fixes the high SWR problem. Now you are all done. Enjoy your new radio. I love mine.

Am currently using an Icom 706 in car and thinking about a change to the
FT-100. Is their an adapter available to adapt the Icom DC cord connector
to the Yaesu type? Would sure make installation easier! Thanks, Tony N2SS

Now, at the risk of labouring the SWR and instability prob. on 12 and 10m, I have, with my new FT100, just the same. Serial no. 9J etc.

I contacted my long established Yaesu dealer in the UK today and he had never heard of this problem!!!

I said " it is not unknown in the US" and he said that the "US spec. is totally different to the UK spec."

That would mean of course that the US models are prone to instability whereas ours are not !

I have been asked to return the rig to them and it will join "numerous FT100's that have been sent to Yaesu UK for various problems" but not my problem.

Noted, thanks, the remedies with barrel connectors etc. Will try it. Must mean that a good mismatch with a bad match works. QSL ?

Should I have bought the Icom 706 Mk2 G and be spared all these peculiarities ????

3307. Re: [FT100] new ft100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-16 03:15:52 UTC
From: Mark Schroder
Topic: 3296 Message: 3307

It seems to me that the SWR problem being solved with a barrel connector and some certain length of coax is being misunderstood. I have the FT-100 installed in my pickup with about 35 feet of RG-8x running to a homemade trailer hitch mount. I DON'T HAVE ANY SWR PROBLEMS!!! Yaesu seems to alude to potential problems at higher frequencies in the manual (page 12): "Mobile antennas for the HF bands, with the possible exception of those designed for 28 MHz, display very high "Q" due to the fact that they must be physically shortened, then resonated using a loading coil."; "On the UHF and VHF bands.....we recommend that all impedence matching .....be performed at the antenna feedpoint.". The ATAS-100 is a very short antenna.

I think that some of the SWR problems associated with using the ATAS-100 have been when installed in a vehicle with a fairly short feedline. One solution has been to add a 6' length of feedline to the original feedline with a barrel connector but that changing the feedline to a 6' longer feedline doesn't work. To equal the loss of six feet of cable when you add two conectors and the barrel adapter you need to make the feedline 18 feet longer. I don't see this as a bad thing, after all we in the ham community are supposed to be ready in the event of an emergency. That extra feedline would come in handy during an emergency, contest or Field Day to string up a quick dipole and operate from a hilltop someplace (with landowner permission, of course). I don't think that is a bad design, on the contrary I think it is a great antenna for single antenna, automatic band changing, automatic tuning use. It just sometimes needs a little undocumented help to perform well.

I use the FT-100 both in my truck and my shack. I have it mounted on an easily removed hump mount that sits well on my desk. In the truck I don't use a tuner and have made some DX contacts with excellent signal reports. 59 from Italy at 10:30 at night on 20 meters and 5 WATTS!!! In the shack I plan to use an MFJ 941 tuner when necessary to tune it into a collins 30L1 and an MFJ 989 after the amp. I am currently building the Tx relay cable to key the amp. Along with the Tx relay I am integrating a PSK31 interface (I don't plan to use the amp with PSK31, I just thought it would be cool to put it all in one package).

I know you've gotten several responses to this question. The answer is
available in the FAQ.

If you ever think you have a question that may have been asked before, check
the FAQ first...you may learn a few more things in the process. Here is the
section entitled: Power Connectors/Line Filters

"An excellent source for power connectors can be found at www.powerwerx.com.
They carry the OEM connectors and shells for the FT100 (and other rigs) as
well as the Anderson Powerpole connectors which can allow you to make up
cables so that it's easier to interchange brands of radios with various power
supplies. They also carry line filters to reduce alternator whine from the
DC power source. "

Another tidbit about powerpoles. I tie batteries into a a battery combiner setup, which means both ends of a hookup can be hot, so any connector system that would have prongs sticking out of either end is worrisome. The powerpoles are genderless (hermaphroditic) with nice recessed contacts, plus they make a neat and trim installation. After only a brief hesitation, I lopped off the native FT100 connector in favor of the powerpoles. Also, I have gotten great service from powerwerx. http://www.powerwerx.com/

I am thinking about putting the FT-100 in my Dakota pick up. Since I can never be sure what other rigs will be there also (I'm constantly changing things around here) I am going to install one of the power pole distribution panels. I believe they will accept up to 4 powerpole plugs. I'm not sure if I want to replace all the plugs on my rigs, but will probably make op a few adapters. We'll see what happens.

Just as another data point on this problem. I started having problems on the higher bands when I made some changes to the configuration in my truck. The interesting part is that when I disconnec the VHF/UHF antenna cable, the HF problems seem to clear up. more interestingly, if I disconnnect only the hot connection to my 2 Meter collinear, most of it goes away also. Kind of makes me think that some of the HF energy is getting back into the VHF/UHF line and causing problems.
I still have a bit of troubleshooting to do to on this because of all the antennas, radios, amplifiers and preamps in the truck, but I get the feeling I'm on the right track.
BTW, for those going to Dayton, I'll be there with the truck. Finding me won't be too hard. Look for the green Hummer wagon pretty close to the tent area near the N.W. corner of the flea market (oops, I mean "Outside Vendor Area"). I'll be the one washing some chorizo down with a couple of Honey Brown's.

I kind of suspected it would be triple conversion in some bands. It is probably single conversion beneath 11Mhz, double conversion between 68Mhz and 11Mhz, and triple conversion above 68Mhz. Does anyone know for sure?

At least with triple conversion the intermod should be low in the VHF and UHF bands. There is some TV beneath 68Mhz, which may cause interference on 6 meters.

Intermod is really a function of where you live (or more correctly use the radio). I'm in the SF bay area and we have pagers that are unbelievably powerful and overmodulated. Hell, we have hotels with more antennas than military bases.

Decoder for above:

Chorizo = Mexican sausage
Honey Brown = A particularly good beer (at least for this side of the
pond).

Hello,
I have been running my FT100 since last December and for my HF antenna (screwdriver) I use enough coax to connect the radio to the antenna. Currently that is 6 feet. I have also used a 12 foot piece and both work well. I run 80- 10 without a tuner. I had to run a 6 gauge ground wire to the frame to make it work on 75. If you would like to see my set up you can at http://www.qsl.net/km6cq/

3319. For Steve, WH6IC / geotool

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-18 21:37:43 UTC
From: Jay
Topic: 3296 Message: 3319

I am trying to get a hold of Steve, WH6IC to ask him some questions about his stake mount installation in his Ranger pickup.

If anyone has his email (wh6ic@... from the call books as well as the email from his web site) I would love to get it from you as the ones mentioned above are bouncing.

If anyone else has used the Geotool (www.geotool.com) stake pocket mounts I would love to hear from you as well.

Thanks - Jay N1RWY

baack@...

3320. FT100 Mods

From: n6tgk@home.com
Topic: 3320 Message: 3320

I jut recently joined the reflector here and I've been reading all
the
posts. It helped me decide whether or not to try the ATAS-100.
Anyway, I've seen many posts relating to "mods" for the FT-100. Am I
correct that there is only one mod out there? I did the MARS/CAP mod
long ago but I was curious as to what else might be out there.

From: ronaldwu1@aol.com
Topic: 3322 Message: 3322

Greetings:

I have for sale a basically brand-new (turned on for maybe 2 minutes), FT-100, along with ATAS-100 antenna (along with the Base Kit). I purchased the gear 2 months ago from HRO, but now realize I don't have enough free time to install it or utilize it (tough when your household has 2 working parents and a 1 year old). So, I figure I would rather sell the gear and give it a good home.

Separately, I would like $750.00 for the FT-100, and $200.00 for the ATAS; or I'll take $900.00 for the lot. Payment by Cashier's Check or Money Order, and I will pay for shipping via UPS Next or 2nd Day.

73's,

Ronald Wu
KG6AHU
San Mateo, California
email: KG6AHU@..., ronaldwu1@...

P.S. I also for sale a Kantronics KPC-3 Plus (like new) and an Alinco DJ-X10E (unblocked) scanner. Please make offer.

3323. FT-100 & ATAS-100 Sold

Topic: 3323 Message: 3323

Thanks everyone for the interest, but the FT-100 & ATAS-100 has been sold as a lot to KC8LTL in Michigan, who was quickest on the draw.

For the info of all those that inquired, the warranty card had not been filled out yet.

73's,

Ronald Wu

Hi,
Yes lots of goodies this year....Kenwood does have a new radio to compete with the Ft 847 & ft 100.....but it is not on the market yet, no release date or price yet.
It does alot of what the ft-847 does plus more on sat. & it adds a extra band 1.2g
and has a built in tuner...100 W on 160-2m, 50W on 440 & 10 on 1.2g.
They have a model version to compete with the ft-100 but its huge...does everything
the base model will but with the detachable faceplate you cannot do the sat's.
What they had there were the only prototypes in existence & the salesman did not seem too up on the radio

I didn't go, but here are some rumors that the FT100 list might find
interesting:

========
I was told the Icom 706 MK II G is lowering the price along with the FT-100
due to Kenwood coming out with the TM-2000
HF -1.2 GHZ mobile radio. The radio looks like a TM-700 mobile radio. I was
also told Icom will retire the 706 name and style after this current model.
The next model with have 1.2 ghz plus look like a IC-2800..basically a large
front multicolored display.
I don't have any dates on the release though. 73's TIM
==========
I will also add that Motorolla is coming out with a base HF radio that will
compete with the Icom 756 PRO and the FT-1000 MP. This radio will be at
Dayton 2000.
Also heard rumers about a Yaesu FT-100 Mark II coming out in fall of 2000.
This radio is a update of the Ft-100.
73's Tim
==========
the Icom 706 MK III will not be called a 706 . I was told by a confidential
source that they will retire the name 706 with the "g" model that is
currently available. The NEW model available no earlier than next fall 2000
will have 1.2 ghz added . The radio will resemble the IC-2800H but with a
bigger VFO knob.I also heard the performance will be much better and is
designed to compete head to head with the
NEW KENWOOD TM-2000 which will be at DAYTON 2000. This radio looks like a
Kenwood TM-700 data radio recntly reviewed in QST. The radio covers from 1.8
mhz to 1.2 ghz. WOW. Kenwood also has
a base/satelite radio called the TS-599
which will also cover from 1.8 mhz to 1.2 ghz continuous and will have a
tuner etc in one box.
73's Dayton will be good, TIM
==========

From: J & D Schnoor
Topic: 3326 Message: 3326

Has anyone else had flaky reception on 2M FM? In fact, this evening a local repeater had weak signal strength, same with other local repeaters, but out-of-band in 155 MHx region was fine. 162.55 Mhz was fine. Is it simply in need of some tuning or is there something else I am missing?

The new FT-100D is out at Dayton major differences are
larger speaker, CTCSS decoder standard, and new CW filter.
FT-100 price is down to 950.00 and 100D is 1250.00 at Dayton
Nothing else new to compete with it that I saw.

There are two new Kenwoods according to the rumor mill. You may have seen the base unit. I can't get too excited about the tweaks to the FT100, nor would I be PO'd had I bought the old one and saw the new one come out IF those are the only changes. I kind of assume most people stick a speaker in the front of the vehicle when they do a remote installation, so I doubt the bigger internal speaker is a big deal.

I don't see the big deal about having 1.2G, though I wouldn't complain if I had it.

BTW, my new vehicle that I was going to stuff the FT100 into got trashed at the factory, so I am playing the waiting game until fall for a 2001. This will give Yaesu more time for you guys to finish testing the radio and get the remaining bugs out. ;-)

I've been using a Geotool stake pocket mount on my 99 Ford Ranger for about 6 months with the 3/8 x 24 stud mount and several HF whips with quick disconnects. I just installed a new Geotool mount to be used with the ATAS-100 just like Steve's. What would you like to know?

Steve, N6TGK

From: Andrew Walker
Topic: 3334 Message: 3334

Nobody told me that if you select ATAS in menu 61 for use in the automobile that you cannot transmit on 1.8 and 3.5mHz when you return to the shack.....did they ? Not in the Handbook, or is it ?

It nearly went back in its box.

When used with the ATAS100 however, I find that it moves to its shortest position i.e. 6m without problem, but it will not extend when changing to a lower frequency without first prompting movement direction manually. Is this yet
another fault or am I missing something ?

AND would you believe, the PA takes off on 12 and 10m despite all my efforts applying the wonderful advice from this group.

Now then, who was asking about the 706MkllG ?.....me I think.

FOR SALE. Brand new FT100 with matching *** *** **.....Never had this trouble with my TS50, pleased I didn't sell it.

Regards to all,

Andrew G3OUT

3335. FS: European FT-100 with FTS-27, ATAS-100, DTMF microphone

Well, I have found out that the Yaesu FT-100 isn't for me. Thus, I am offering for the sale the following package which is about three weeks old:

Yaesu FT-100 (European model) with FULL transmit and receive from virtually 100 kHz to 961 mHz.

ATAS-100 mobile antenna

FTS-27 CTCSS decoder installed

US DTMF microphone

New, all of this was $1,600

I am asking $1,400 or best offer. I will ship to the US.

Hello all,

I just installed an ATAS-100 on my '99 Ford Ranger to use with my FT-100 after using the tuner and several HF whips. When I bought the tuner I was torn between buying the tuner or the ATAS-100 and eventually decided on the FC-20 and whips because I thought it would be more efficient and I just didn't know how well the antenna would work. After six months of using the tuner and several whips I got tired of having to change whips when I changed bands so I broke down and decided to try the ATAS-100 after reading several of the posts here. I only have one thing to say: I wish I had bought the ATAS-100 in the first place. I'm amazed... the thing really works and works just as well, as far as I can tell, as my tuner/HF whips combo I was using. I had already bonded the cab and bed of the truck to the frame in several places, yet I was still anticipating problems with performance on some of the lower bands but to my PLEASANT surprise the darn thing loaded up on all bands with a great SWR, based on the internal meter on the radio. However, I'll be checking those with an external one later today but so far I'm pleased.

Now for my question. While I have no problems with 10 thru 40 meters (including 30, 17 and 12) I need to know if anyone else has had a problem getting the antenna to load on 6 meters? I'm not even going to use it on 2m/70cm since I had already installed a Larsen dual-band some time ago and they work better than the ATAS-100 anyway. The antenna retracts all the way as it should but the radio indicates it can't find a match. I've thought about trimming the whip but I want to hold off on that until I've had a chance to ask some people here.

Thanks,
N6TGK

hi regarding the question on the atas loading on 6 meters . i just recently installed my atas on the back driver side door of my astro. i ran two pieces of braid between the bottom of the mount and the top of the van. a 2m/440 comet whip mounted on a ladder rack is about 18 inches from the atas100. so far in testing i have been able to get very good vswr on 40 thru 6 meters the atas works great no take off on 10 and 12 meters the only thing i can see so far is every once in awhile from a cold start of the fan bearings is noisy for the first few seconds. otherwise so far a great rig. oh yes i also ran a ground wire from the floor of the astro to the mounting bracket on the ft100.

The six meter position isn't full retracted; thats the 2m/70cm position. For six meters, its nearly fully retracted; i.e. more retracted then 10m, but less retracted then 2m.

Doing the math, I see the Kenwood's control panel is 10.6x3.8, which doesn't sound very DIN to me. Looks like I get either the FT100D or see what Icom new radio looks like. Receiving UHF/VHF and HF at the same time sounds like a nice feature. The way the specs read, it sound like the new Kenwood can do 100 watts on two meters.

Thanks for the link. Here is the direct path:

I have been using the ATAS ant for a little over a year now. First with a FT 847 and for the past 2 months with the FT 100. I have no problems loading on all bands including six. I have worked 60 grids and 27 states with this ant and get nothing but good reports. Hope this helps. I use the MFJ gutter mount on a 92 ford mini van. Michael NH6CJ

Nobody every told you???? You must first ask...

It looks like you might have discovered an 'undocumented feature'. It would make sense that the rig would attempt to protect itself and prevent you from wasting time when trying to operate the ATAS below 7Mhz. The manual states that the ATAS only works down to 7 Mhz, but doesn't say anything about disabling the output below that. One would have to discover it by applying deductive logic, as you did.

> It nearly went back in its box.

Don't get mad, if you asked the question on this list, you might have gotten an immediate reply by someone who also discovered this feature by themselves. In any event, I'll put it in the FAQ so that others might benefit from your discovery.

> When used with the ATAS100 however, I find that it moves to its shortest

this
> yet
> another fault or am I missing something ?

Now this sounds as if something is really wrong. I am not sure what you mean by 'prompting' the movement. If you get a good match, the antenna will automatically go in the proper direction when moving from band to band when you hit the 'TUN' key.

> AND would you believe, the PA takes off on 12 and 10m despite all my
efforts
> applying the wonderful advice from this group.

Some people have resorted to returning it to the factory. I know the salesman told you that 'no one else in the UK reported the high SWR problem'. Well, feigned incompetence seems to be a common problem with technical support people in general. I think they train those support people to play dumb when they hear about a common problem to avoid a flood of products from being returned unnecessarily if they say, 'Oh Yeah! everyone's been having that issue'.

A lot of us have been able to work around the SWR issue by experimenting with different feedline lengths. A barrel connector will do nothing for it, except allow you to splice in different lengths of cable. I got no benefit from anything except varying the feedline length. If you really want to kill the problem Yaesu has been reported to apply a better grounding to the filter case internally.

> FOR SALE. Brand new FT100 with matching *** *** **.................Never
> had this trouble with my TS50, pleased I didn't sell it.

The majority of the problems you're experiencing are the result of the ATAS100 which is the accessory that truly distinguishes this radio from all others. We are all early adopters of this technology which may someday be used on all mobile HF rigs after Yaesu figures out how to make it work easily enough that the others can copy it.

I can't imagine trying to tune an antenna while driving along so I'm willing to put up with the teething problems of the ATAS100 but as you can read on this forum, not all customers are so inclined.

I don't think this is a defect. The FT-100 manual mentions something about the antenna retracting and that the FT-100 waits a certain period of time to assume the antenna is fully retracted (assuming from a fully extended position). After
this period of time of expired the antenna then goes through the tuning process again starting from the retracted position. I may not be stating what the manual
says for word but it does mention something in the manual about it.

When I sent mine in everything went with it. I'm not sure they need it all, but I just thought better safe than sorry. By the way they were able to turn it around in less than a week. If your interested, and use the internal speaker, I understand from the tech that I spoke to at Dayton that the speaker change over is simple. They just swap out covers and plug in the new one. You might ask, they may just charge you for the cover as they will have to remove the cover anyway.

All:
Just before going to Dayton I was able to confirm that this problem is the result of HF energy returning to the radio via the VHF/UHF antenna connector. You should be able to confirm this by disconnecting the VHF/UHF antenna connector and re-testing operation on the higher HF bands.
The nice people at Yaesu confirmed exactly that when I went to talk with them at their booth. He said that the HF signal coming back in the VHF/UHF antenna port is being coupled into some nearby circuits and causing problems. I asked about the shielding/grounding fix and he told me that this will not totally fix the problem and that I need to send the radio back in, which I'll do shortly.
The thought about the cable length fix is that the added cable is changing the phase of the returned energy and resulting in less effect in some cases.
So, there it is. Definitive confirmation of the exact nature of this elusive problem. My suggestion is that everyone who is having this problem return their radios for this fix, even if adding the coax has improved the situation. But, let's not return them all at the same time, and certainly not before I return mine. :)

I am not sure if condx were very poor at the time of the "discovery" but I could not hear anything on 1.8 or 3.5mHz either. Not amateur at least. Can't believe the ATAS is that "dead" on 80m.(Sorry 75m !!)

Regarding prompting the direction. When I started to tune from 6m to 20m I could hear the motor running but obviously in reverse. As has been suggested, there is a timer built in that may have reversed the direction had I waited. But I didn't. So I pressed the PTT and the UP key for two seconds to start it off. It would then tune normally.

I am indeed honoured that a contribution from ME will find it's way into the hallowed archives of the FAQ !! Thanks Lee, a printout of same is always by my side !

Another little point. With the ATAS I press the "Tun" key briefly and nothing happens. If I hold it in for a half second it "goes bold" (so will I soon with all this hassle) and tuning commences. Is this normal ?

Again, very many thanks to all who responded. I have sent an email to Yaesu USA asking about the 12/10m anomaly since it does not exist in the UK !! So when you awake over there hope for some good news.

Anyone in the UK on this group with a rouge FT100 ?

Thanks Chuck, but all my problems are without anything connected to the
VHF/UHF
input. Following this line of thought I have shorted it out, connected a
dummy load and even stuck my finger up it. Nothing makes any difference
whatsoever. My rig takes off even with a dummy load directly on the HF
connector and the power out set at zero. So in my case it is not RF
feedback. Something is oscillating somewhere that shouldn't be oscillating !

Would somebody on your side of the Pond tell somebody on this side of the
Pond what is wrong please ! Or should I ship it to CA.90703 ??

Can't
> believe the ATAS is that "dead" on 80m.(Sorry 75m !!)

The 80 and 160 meter bands can be pretty dead during the day time. I've
never been able to hear anything on 160 meters even on my G5RV (which isn't
intended for use on 160 meters), and it's 102' long.

> Regarding prompting the direction. When I started to tune from 6m to 20m I

Sounds like it could explain the problem. If the ATAS doesn't tune properly,
it needs to find home before it will tune again. This involves retracting it
and running the motor for an extra minute or so just to make sure it's fully
retracted before it reverses direction and begins to extend the antenna
again.

> I am indeed honoured that a contribution from ME will find it's way into

will
> I soon with all this hassle) and tuning commences. Is this normal ?

This is normal. You must hold the button in for 1/2 seconds to go into
autotune mode.

This was one of the first things I tried and it had no effect. There's no
doubt that RF is getting back into the rig, but it appears that it may be
using different paths, depending on the particular radio and installation.
RF is a sneaky thing. If you close the front door, it will find a back door.
Once it gets in, all bets are off, since the manifestations of a confused
circuit can vary wildly.

Andrew:
You'll note from my other receint post that I think I'm still seeing
some minor effects even when the VHF/UHF antennas are disconnected. I
believe there may still be some coupling from the HF output circuitry to
the circuits that are sensitive. I suppose it's possible that in your case
it's worse. My guess is you'll have to have the radio updated.
Quick question, does your radio tend to pulsate at about a 1 or 2 second
rate when it's having this problem, or are you getting interference into
other radios as you crank the power up. Those are both symptoms I'm having
with this problem.

Chuck

3360. Unknown Mic button

Andrew .. I have a FT100 remote mounted in my car and I've ahd no problems at all .. I have a seperate antenna for 2/70 adn I use my home made screwdriver for HF. Also I've added my own hands free mic which sounds fine. Not sure why your having problems
Here is my installation if you want to take a look

http://www.j1mbo.f9.co.uk/m0cke.htm

Cheers Jim M0CKE

P.S. Get onto Yaesu UK they are very helpfull. My FT847 have been back twice now .. returned within 2 weeks on both occations.

Looking forward to playing with th Kenwood TS599 when it comes out .. it looks a stormer!

To use a mic other than stock mic for FT-100:
Is this correct ?
Use pins 4(ground), 5(mic audio) & 6(PTT)
Place a 27k resistor across lines from 4 & 6
Is a capacitor also used somewhere in this scheme?

3363. Different mics/audio setup on FT100?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-22 18:59:01 UTC
From: GW
Topic: 3363 Message: 3363

Has anyone experimented with different microphones on their FT-100s?
I'm still somewhat dissapointed with the TX audio quality reports I've been receiving, and hearing with the help of the other parties tape recordings of myself.

I recently purchased a 6 conductor modular plug and plan on trying either an Astatic mic or perhaps a handheld Kenwood. I've played around with the numerous DSP mic settings, (both with and without the compressor). I also adjusted the TX carrier offsets for USB/LSB, and have found that I sound acceptable with the compressor off and the DSP mic equalization also set to off. I currently have the TX carrier offset set to +100 for LSB and -100 for USB. I did these tests with the help of my tape recorder rolling while I was out in the mobile.

I would appreciate knowing what others may have discovered, as well as how they have their mic settings adjusted. Perhaps it's just me, but the TX audio from
my TS-50 simply cannot be duplicated with this rig.
.
Thanks in advance....
Gary

I would love to find out how to "crack the code" on yaesu's method of multiplexing DTMF, PTT, Mic audio & whatever else they run on the MIC IN pin on the MIC connector. I have been able to input audio from my sound card by building a 100:1 voltage divider but I haven't been able to access the PTT. I have tried to use the PTT on the DATA jack but that cuts out the mike by design.

Mark - AF4TL (former N3XCM)

P.S. Heil has an adapter cable specifically for the FT-100 for use with their mics.

3368. ATAS-100 mounting on a car? Comparison to random wire auto-tuner?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-22 21:08:13 UTC
From: David A. Jaffe
Topic: 3368 Message: 3368

I'm considering getting an FT100/ATAS-100 for my 95 Honda Civic sedan (v6 model).

Having read this list for a week, I hear some strangely contradictory reviews:

1. It's great, I love it
2. It's terrible, I'm getting rid of it

I'm wondering if the difference might have to do with the kind of vehicle it is mounted on.

So... (pardon the fact that I'm asking several questions here)

Has anyone successfully used the ATAS-100 on a 'regular' car, as opposed to a truck/RV/etc.?

Perhaps the grounding is more problematic on a car because there's less metal?

Also, to add to my problem, my car has a sun roof. There is a little space behind the sun roof (near the back window), but the antenna would be leaning back a little (not sure that matters).

Another option is on the trunk, but I'd have to take it off to open the trunk.

Yet another is on the side.

Finally, the other "automatic" solution I'm considering is a "random wire+tuner" type mobile set up. Has has anyone compared the ATAS-100 to one of these, such as the ICOM AH4/AH2b combo? Not that the AH2b is a 9 foot antenna. (Yes, I realize that the AH4 is for ICOM, not Yaesu equipment; it's just the one I'm familiar with because I have an ICOM base station.)

Thanks
David
WA2BHJ

I have my FT-100/ATAS-100 combo mounted in an Audi A6q sedan. Antenna is
on a Comet CQ5M quick disconnect mount, mounted on the passenger's side
of the trunk lid. No special grounding at all, just grounds through the
set screws. Unit is remote mounted under the rear deck and well grounded
there. SWR matches on 440 - 40m without any problems from day one.

I am using the AH-2B vertical with a SG-230 tuner mounted on my Jeep Wrangler. It works great and will tune the AH-2B from 160 thru 10 meter. I also have the AH4 tuner but it requires a tuner signal to tune and I could not get anyone to give me any insight as to what I would need to feed it to get it to tune. The SG-230 is a bit bigger than the AH4 but it does exactly as advertised. The only problem I have encountered is the FT-100 believes there is a bad SWR on 20 meter. The tuner indicates it is tuned but the 100 pulls the power down to abou 40 watts. I plan on trying different lenghts of coax and see if that cures it.

Jim
If I remember correctly you bypassed the automatic tuning feature to
get access to the 80m band. I am just wonder if the people that are
using the AT-100 are not able to hear 80 & 160 m because of the Q of
the antenna and the fact that it is only supposed to resonate down to
40 meters. I have the schematic and was going to order the S8100649
Chip and add the circuit to my DK3 . I was just wondering how you
have menu item 61 set . I am assuming Atas-1?

I second the good doctor's comments. I have my ATAS mounted on the side
of the trunk-lip on a 1997 Pontiac Grand Prix. For a long time I simply
used a 20' long counterpoise of wire wraped around the inside of the
trunk.

FLAT SWR on all bands including WARC.

Well, I've only been using the ATAS-100 for about two days and
I haven't really had a chance to test it out being as busy as I was
over the weekend. However, I too, was using Hamsticks. I was
using one for 10 meters running into a tuner which gave me good
coverage down to 20 meters and then a 40 meter ham stick that
gave me good coverage there. Since replacing the whips with the
ATAS-100 I haven't noticed any decline in signal strength at all.
As far as being heard, I haven't worked any DX yet since I haven't
had the time but I did talk to three gentlemen on Saturday afternoon
while mobile here in San Diego. One gentleman was in Phoenix, AZ the
other in Prescott, AZ and the third in Las Vegas, NV.

The one thing I have found with the antenna is that was nice with the
Hamsticks was that if the ATAS-100 is tuned for 10 meters, it will be
quite deaf on 20 meters or WWV at 15MHz so you'd have to tune the
antenna for 20 meters to get good reception, whereas I didn't have to
do that with the 10 meter Hamsticks. But it's not much of a problem.

If you do get an ATAS-100, do make sure it is grounded as everyone here
has stated. I had already done that trying to eliminate a noise problem. My
truck's cab is grounded to the frame twice, once on each side and the bed
is grounded to the frame four times, once in each corner of the bed. I'm
able to load all bands with a good match with the exception of six meters
but I'm working on that.

Overall, I'm pleased with the antenna.

Greetings:

I have a few other items that I'm "cleaning house" with. If interested, please let me know asap, as I know they'll go fast. S&H will be by UPS Ground or 2nd Day, at your request.

- Kantronics KPC-3 Plus TNC. Version 8.3. Used very little. Factory modified to run also on 9V battery. Have Manual, but no box. Asking. $120.00 + S&H (MSRP $170.00)

- BayPac BP-2M Multi-Mode TNC. Brand New. Asking $45.00 + S&H (MSRP $69.95)

- Astron SS-25 Power Supply. Like New. Cosmetically perfect. Asking $85.00 S&H (MSRP is $120.00)

- Cushcraft AR-270 Ringo 2m/440. Like New. Never even been outdoors. Asking $50.00 + S&H (MSRP is $84.95)

- Cushcraft AR-270 Ringo 2/m/440. Brand New in Box. Never opened. Asking $65.00 + S&H (MSRP is $85.95)

- Palm Pilot IIIe, (loaded with registered version of Mark/Space Terminal software V. 1.3.1 so it can be used with Kantronics KPC-3 Plus TNC above). Like New. Have manual, but no box. $95.00 (MSRP $149.95).

3382. Antenna mount suggestions

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-23 04:22:38 UTC
From: Rob Boux
Topic: 3382 Message: 3382

Hello group,
Anybody have any mounting suggestions for a dual-band 2/70 antenna mount for a 1999 Blazer with sunroof and roof-rack? I've thought about Comet and Diamond mounts... but which model will mount on my roof-rack? How have others mounted antennas on Blazers and Jimmys? I don't want to mount the antenna on my hood as I want to get the antenna up as high as possable, plus run an amp and don't want to get "nuked" with the antenna right out-side my windshield drivers side.
Any suggestions would help me make a choice as I don't have a dealer in my city to check out the different mounts etc..

Hi Rob

I have the Olds Bravada 99 which is very similar to yours.

I have my 2/70 ant mounted on the forward luggage rack bar. It has worked very well for quite a while.

I had bracket made for the HF antenna that plugs into the trailer mount. it then has a 90 degree fitting and then comes up just off center from the tailight.

I have not had my FT 100 installed yet, however I will have some time this coming weekend and hope to make some progress on that project.

Hi .. I've found that with the stock microphone the best setting for the compression is 20 .. any higher just adds distortion, also using the compression disables the usb mic gain ... why?
I use a hands free amplified electret in the car, this I've found that the compression needs to be run at about 60 for best results .. again any higher just adds distortion.
I hope this helps, get some local amateurs to do some tests with you on ssb, the adjustments can be made whilst in tx mode, they will soon tell you when you go OTT with the compression.

Cheers .. Jim M0CKE

Hi John .. Well unless the manual is incorrect I have the menu 61 set to
ATAS 2 as I have a separate ant for 2/70 bands.
When I want to go onto 75/80m I have to turn menu 61 OFF as this prohibits
PTT on any band less that 40m when set to either ATAS 1 or 2 but I find it's
no hardship.

Good luck

Jim M0CKE.

PTT is on SW1 via a 27k resistor switched to Ground
I use a Hands Free mic .. I made a voltage divider as the FT100 gives out 9v and the electret circuit only needs 5v. This along with a decoupling capacitor is all that's needed .. My audio sounds "like me" with no funnies going on

Hope this help

3388. FT100 Part IV

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-23 08:22:14 UTC
From: Andrew Walker
Topic: 3388 Message: 3388

Chuck wrote,

{Quick question, does your radio tend to pulsate at about a 1 or 2 second rate when it's having this problem, or are you getting interference into other radios as you crank the power up. Those are both symptoms I'm having with this problem.}

The rig slightly pulses the RF out when my auto ATU tunes my shack antenna correctly and all is normal. When it is unstable I can do nothing with it and there is a constant 4 watts odd output thru my power meter even with the PO set to zero. Listening on another rig there is a strong carrier on the freq. set on the dial that sounds normal and can be modulated.

Nothing yet heard from Yaesu USA. Will log on now (we have to pay over here, 'phone call at least !!!)

Looks like it just includes some options as standard and a new speaker. No matter I use a nice Motorola speaker rated a 20W overhead and it has plenty of clean audio.

I see this as a forum to work on problems and get first hand information. If every one sent e-mail just saying mine works great, what else would there be to discuss. We all want to learn and make our installation and operations better.
I love mine. I took it on a business trip to DC and slapped it into a rental car and it
worked flawless on all bands. I move the 100 and ATAS between my Dodge quad cab,
to and 86 Cadi to a 75 Chevy and have had no problems with the antenna tuning
or any thing else mention here. Install the equipment and go from there, if you have
problems then this is the place to let us know and you'll get them worked out.

Subject: [FT100] ATAS-100 mounting on a car? Comparison to random wire auto-tuner?

I'm considering getting an FT100/ATAS-100 for my 95 Honda Civic sedan (v6 model).

Having read this list for a week, I hear some strangely contradictory reviews:

1. It's great, I love it
2. It's terrible, I'm getting rid of it

I'm wondering if the difference might have to do with the kind of vehicle it

is mounted on.

So... (pardon the fact that I'm asking several questions here)

Has anyone successfully used the ATAS-100 on a 'regular' car, as opposed to

a truck/RV/etc.?

Perhaps the grounding is more problematic on a car because there's less metal?

Also, to add to my problem, my car has a sun roof. There is a little space

behind the sun roof (near the back window), but the antenna would be leaning

back a little (not sure that matters).

Another option is on the trunk, but I'd have to take it off to open the
trunk.

Yet another is on the side.

Finally, the other "automatic" solution I'm considering is a "random
wire+tuner" type mobile set up. Has has anyone compared the ATAS-100 to one

of these, such as the ICOM AH4/AH2b combo? Not that the AH2b is a 9 foot
antenna. (Yes, I realize that the AH4 is for ICOM, not Yaesu equipment;
it's just the one I'm familiar with because I have
an ICOM base station.)

Thanks
David

Hi John...

Could you give a little more detail as to the installation in the rental car?

did you use a mag. mount for the antenna? do any special wiring hook-up? etc.

Thanks,
Tom, N4GVK

Hi Gang:

Has anyone put an SWR bridge in the line and measured what 2-3 bars on the FT-100 scale mean? I can tune up on all the bands with 2-3 bars on the FT-100 and I assume that's around 1.5 : 1. But, I don't know for sure.

Performance has been good and I love my new FT-100/ATAS-100.

Thanks for the info,

KA6K - Tom

>
>KA6K - Tom

That's a good question and one I'm going to be checking now that I have the ATAS-100 installed. I know that when I was using a Francis 102" fiberglass whip, I cut it until I got only one bar on the meter of the FT-100 on 10 meters but when I checked it with an in-line SWR meter the SWR was still 2:1... not what I would say a good match. Whether or not installing the in-line SWR meter threw the match off or not I don't know but I'd wager that the meter on the FT-100 isn't the most accurate tool to use.

Try pushing a touchtone button while transmitting. You'll probably find that
it is a red light to indicate toning.

Hi Steve:

Ya, I don't know what 2-3 bars is equal to. But, hopefully someone will cue us in on that. The only thing I do know, is the FT-100 SWR scale is very reliable! I saw one study that proved that. So it's a good measure of your SWR. But, don't know if my 2-3 bars is good or not. I can get down to 1 bar on most of the 20m band.

I just ran a test using the FT-100 at 3.500MHz into an MFJ 815B SWR meter and then into an MFJ 941 tuner and then an 80/40 Dipole. I adjusted the SWR using the tuner to give 6 down to 1 bars on the FT-100 (I get the high SWR icon with the 7th bar). After reading each bar on the FT-100 I read the SWR meter and then disconnected the coax cable at the pigtail on the back of the FT-100 and attached the coax cable to an HP-8714ET Network analyzer and read the SWR. Here's what I got:

Bars on FT-100	SWR Meter	HP-8714ET
6	2.4:1	1.9:1
5	2.1:1	1.8:1
4	2.0:1	1.6:1
3	1.8:1	1.5:1
2	1.6:1	1.4:1
1	<1.6:1	<1.4:1

I have noticed that the power readings on my MFJ meter are about 20 watts low on the Lo setting so that would explain most of the difference in the readings from the HP.

I hope this is useful information to all.

Mark AF4TL

From: Leo KJ6HI <radioleo@...>
Subject: [Kenwood] The NEW Kenwood/VHF/UHF
Date: Tuesday, May 23, 2000 06:04

This is a description of the NEW Kenwood HF/50/144/440/1200 MHZ rig.

The bands it covers......

10-160 meters 100 watts
50-54 MHZ 100 watts
144-148 MHZ 100 watts
430-450 MHZ 50 watts
1240-1300 MHZ 10 watts ALL MODES
This radio has TWO separate receivers.....

1. The main band uses IF DSP and uses all modes
2. The sub band uses AF DSP and uses AM/FM modes only

The sub band receives 118.000- 174.000, & 220- 512 MHZ.
These are some examples of what you may see in your display...

HF/144
HF/ 440
1200/144
1200/440
50/144
50/440
144/144
144/440
440/440
440/144

3. This radio is a full functioning Satellite rig using IF DSP
4. Built-in Automatic antenna tuner that covers 10-160 meters.
5. Built-in 1200/9600 baud TNC
6. Built-in Kenwood Sky Command (HF Remote control with a TH-D7A, &
TM-D700A)
7. Built-in DX Packet Cluster Monitoring

Example when you are listening to 20 meters in the main band you have the 2
meter DX Cluster frequency in the sub band with the TNC engaged if a DX spot
comes up the FREQUENCY/ UTC TIME/ AND THE DX STATIONS CALL SIGN WILL SCROLL
ACROSS THE SCREEN. If you have the menu set a AUTO this information with get
transferred to the main band automatically...
WOW !!!!!!!!!

8. External RX antenna connection (for a beverage antenna)
9. Built-in Electronic Keyer
10. Large Amber LCD display has a slanted aero dynamic look, and all the front panel buttons are BACK-LIT in darkness you may see all the keys, and their functions.
11. Built-in Preamplifier
12. Built-in CW Auto Tune
13. Beat Cancel
14. 5 antenna ports
15. Direct RS-232 port on the rear panel, you do not need to buy any external interface unit to connect it to your PC, its just a snap DB-9 to DB-9 straight cable that's it...
16. You may use the Kenwood RCP software to control the rig.
17. It is a 12 volt unit and uses the same mobile bracket as the TS-430S, 440S, 140S, 680S, 690S, 450S, 570D/S

THIS RADIO COMES IN THREE CONFIGURATIONS...

1. The complete radio with the nice LCD amber display
2. The "Black Box" with no display, in this case you may use the RCP software to control the radio with your PC
3. You may also use the Black Box and connect the REMOTE DISPLAY for use in your car. It is small and compact like the Kenwood TM-D700A remote display.
4. You may also use the complete radio and use the Remote Display in your car.

The radio is NOT FCC type accepted, it does not have a model number, estimated price, or delivery date hopefully it may be available at the end of the year.....

I've already taken an informal poll on people's opinion of the new Kenwood HF rig:

Now you have my attention. Are you saying Kenwood is going to supply a DIN size controller for car use, with probably more menus to make up for the lack of buttons.

What would really be nice would be if you could have one controller drive either this new Kenwood dc to light box and some other Kenwood that was just VHF/UHF. That would let you keep the killer radio in the house, but put it in the truck for use in areas where you really need HF. [How often do you hear people yacking on 3830 when they could probably be using a repeater. Generally pretty often.] While some people like to rag chew on HF for hours, I'd want the capability for use in very remote areas.

Incidentally, with code requirements becoming easier, you have to wonder why the new radios have some many features for CW use, such as the FT100D have a built in CW filter. I don't want to start an informal survey via email, but if someone knows how to do one of those egroups surveys, an interesting set of questions would be:

1) how often do you use CW
2) would you buy a radio that had no provisions for CW

3403. 12m/10m SWR Hint&Kink/Fix

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-24 01:22:19 UTC
From: Scott Townley
Topic: 3403 Message: 3403

I recently reconfigured my FT100 mobile setup (FT100 with separation kit, HS1500 screwdriver) and started experiencing intermittantly bad SWR on 12m and 10m operation...output power as indicated on the LCD bar graph display was all over the map and the "Hi SWR" icon would light intermittantly. And interestingly enough, the HS1500 wouldn't tune the low end of the 80m band anymore either...the indicated output
power wasn't unstable like on 12m and 10m, but I seemed to run out of tuning range in the antenna.
Upon confirming with my Autek VA-1 that the antenna SWR was indeed proper on 10m and 12m, I figured that either (1) I had a radiated feedback path to the radio or (2) the finals were fried. (2) seemed most likely since I've seen all the other tales of woe regarding this issue.
But, I keep a large pile of iron (read: ferrite sleeves and rings) around for just such instances. In my case, two turns thru a 1/2" ID, 3/4" long mix 43 sleeve on the EXT SP cable cleaned everything right up...full stable output on 12m/10m now. I also checked 3.501MHz and the HS1500 tunes up full output again there too.
Note that in the Yaesu separation kit, the display remote cable has a ferrite sleeve incorporated, but the extension cable for EXT SP doesn't. In my reconfiguration I had added the SP-7 and used a Y-cord
so I had speaker and headphones in parallel, evidently either the SP-7
or the paralleled connection was the susceptibility point.
Note that to be effective the ferrite needs to be added as close to the EXT SP jack as possible.
Hopefully, this will help someone out there!

Hey Scott, thanks for the information on the speaker cable and the cores. I took a look at your web site and I have to say...

T H A N K Y O U !!!!!!!!!!!

I have recently just purchased a 2000 F150 extended cab as well as the FT-100, and while my promary interest in ham radio is VHF weaksignal and EME, I do find that I am excited about getting the FT-100 operating with my ATAS-100.

You site has a TON of ideas that I was considering, but you went ahead and did. Thanks again!

I look forward to copying about 99% of what you have done with yours and putting it in my truck. Thanks for the tip on the power cables as well as the grounding issues. WHen I get it all done I will be sure to send some photos if you want to see them.

And oh yeah, aren't those vents GREAT for passing cable?

Thanks!

Jay N1RWY

Beats me, but I decided to do some checking with my
installation. I'm usng the ATAS-100 and I tuned the
antenna to the different bands that it covers except for
30 meters since I won't be using CW while mobile and
six meters where the antenna refuses to tune. I used
the internal SWR meter and a Diamond SX-2000 external
meter... whether one or the other is accurate is uknown
and installing the meter in line could certainly change the
SWR but here are the results of my checks:

28.500: FT-100 - 2 "bars" Diamond - 2:1
24.930: FT-100 - 1 "bar" Diamond - 1.2:1
21.200: FT-100 - 1 "bar" Diamond - 1.4:1
18.110: FT-100 - 2 "bars" Diamond - 2:1
14.175: FT-100 - 2 "bars" Diamond - 2:1
7.150: FT-100 - 2 "bars" Diamond - 1.5:1

So I guess with this information I can assume on my radio
that anything with 2 "bars" could mean a match anywhere
from 1.5:1 to 2:1 and anything with 1 "bar" is really good.

I don't see why you wouldn't want to be seen in the Kenwood both. ADI perhaps, but what's wrong with Kenwood.

There are two types of front panels: menus and a knob for everything. Menu based designs are much cleaner, usually a big knob and "soft" buttons. The Kenwood prototype looked like the knob for everything design.

The fact that kenwood may offer this radio with either type of panel is pretty innovative if true.

I just tried a similar test using an MFJ259 SWR analyzer and got the
following results:

Bars SWR
1 1.5
2 1.7
3 1.9
4 2.1
5 2.4
6 2.6
7 2.8
8 3.0

I only ran it on 10 meters at a frequency of 28.480Mhz so I'm not sure what
you'd see if the experiment was duplicated on frequencies or other bands.
The test involves a lot of connecting and disconnecting and stepping the ATAS
antenna ever so slightly between readings.

I added this information to the FAQ under a section entitled "SWR bar graph meter interpretation"

3410. ATAS autotuning explained

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-24 06:06:52 UTC
From: lee810@aol.com
Topic: 3410 Message: 3410

Thanks to Ed Moxon, I just added the following section to the FAQ which explains how the autotuning process works and how it can get confused:

ATAS-100 Autotuning
The tuning behavior of the ATAS can cause confusion unless you understand the algorithm it follows to find a good position. Normally, if the ATAS is installed correctly and it successfully autotunes itself, it will always go in the correct direction when you press in the TUN button for 1/2 second once it has found its first good match. However, it the ATAS cannot find a match, it will run all the way to one end, turn around, and start over. This process can take a while since the antenna runs 'open loop' when it loses its position. Since it doesn't know which position the antenna is in unless it makes its own successful match, it needs to be sure it has gone all the way to the end before reversing, which can take a very long time.
Anytime it is not sitting right where it found a match all by itself, it can end up starting out in the wrong direction next time. Examples would be if you manually do even just a little fine tuning, or if you interrupt autotuning and change bands. Then the rule is very simple: it starts the next autotune by going in the last direction it was going in, which is not necessarily right. If it's going in the wrong direction, the antenna will move all the way to a stop and then it will have to turn around and start over again after a long delay. If you recognize that it's going in the wrong direction, you can avoid the long delay by aborting the autotuning process by hitting the TUN key momentarily, then manually move the antenna just a little (with the PTT and up or down keys) in the correct direction, and then recommence with the autotuning procedure.

Gary:
My dislike for Kenwood is based on an issue I had with them over the TH79A that has unfortunately rendered me incapable of buying a new Kenwood radio. However, I would agree that they are being highly inovative and are certainly exploring areas of design and functionality that are both interesting and benificial to the art of Amateur Radio.
Despite my initial reactions (listed below) I'll be waiting patiently for the radio to actually be released. If for no other reason that it will drive the other manufacturers to enhance the capabilities of their radios as well. Frankly though, this is what I don't understand about Kenwood displaying this radio at Dayton when it's not going to be available for at least 6 months. While this may give them an opportunity to respond to feedback from potential customers well in advance of finalizing the design, they're also giving the other manufacturers plenty of time to adjust their future products.
As for design concepts, I like the knob for everything design for home use and menu operation for mobile for obvious reasons. Note however that offering a radio with different user interfaces isn't new. An example is the Yaesu radio (can't remember the model) that came with either a normal front panel or a mic with all the controls on it (affectionatly called "Mr. Potato Head" by my partner who has one). Extending this concept, I'd think there's a market for a radio independant control head that's capable of being connected to a variety of radios via the computer interface or whatever that provides enhanced capability, a standardized interface and capable of driving multiple radios.

Hello All,
Well I've been reading for a month now and seems like I was right,
I need a FT-100:-)(that's what I'm TELLin her) and the ant..
#1, Does anyone see a problem with using the ant on my boat?
everything is bonded with #2 copper to the keel which is 8000lbs of
lead, I was going to mount it off the stern rail.
#2, or the mast is 60ft up but if something goes wrong it's a bear to
get up there.. I'm just feeling a little uneasy about the reliability
of the ant?? how long has anyone been using theirs?? Any comments
please.

Thanks Mike WD9EOU

No problems here, if you attach the base of your mount to the same copper
as the rest I don't see why it would not work great too.

I've heard the SWR scale is very accurate too. I just don't know what
1, 2, or 3 bars means?

I don't know either, except for tests others have performed. That's fine.
For me, the absolute numbers of what each bar means is not important.

All I'm concerned about and all I want is that at minimum displayed SWR, the
radio is putting out full (per menu item 21, 22, 23, 24) power. That's what
it is designed to do and seems to do very well.

If it was indicating minimum SWR and shutting down the RF PA, then I would
be very concerned and upset.

Mike:
Go take a look at the SGC information at http://www.sgcworld.com/.
Particularly download their tuner manuals which have some good points
about HF installations in boats. Much of this information is appropriate
even if you're not using one of their tuners. I'm sure there's other
sources as well.
In any case, it appears that everyone suggests using copper strap rather
than wire for your ground connections. Depending on how much metal you
have associated with your vessel's ground system you may want to add some
additional copper flashing along the inside of the hull, particularly in
fresh water, to improve the counterpoise and reduce the amount of RF
current in your vessel's equipment.
Noise from other equipment is another concern, but I think a wait and
see then fix approach is the best for that.
I'll also be installing a radio in a new boat this summer (my FT-847
and LDG AT-11 tuner). Since it's a power boat, I've contacted the
manufacturer to see if they have prepaired a location on the boat with
copper flashing for mounting an HF antenna. Haven't heard back yet, but
I'm hoping they have.
In your case you may want to consider using the backstay for the
antenna. It shouldn't be too hard to insulate it and feeding it will be
easier than installing another antenna. If you use and automatic tuner
like the SGC or LDG, you'll be pretty well set except for VHF/UHF. For
that, just put a small angle bracket at the top of your mast and use a
mobile dual band with one of the little Motorola type mounts. On my last
boat I actually used a Diamond X50 on a marine mount on the top of the
radar arch. Surprisingly, very few people asked me about the radials.
Good luck with the install and keep in touch on it. I'll let you know
when I finally get started on mine, which probably won't be till late
June.

I've been using my atas 100 for just over a year now on the car. I live in B.C. Canada, and drive on the highway every day, including through the winter with snow and freezing temperatures. No troubles so far. I've read of the occasional person (perhaps just one) getting some water in theirs, with predictable results, so I wouldn't attach it anywhere that it might end up submerged.

This was done watching for where a bar just flicks on, and applies to 40m
also.
It's reassuring to see that this is about what Lee got on 10,
and not far off from Mark on 80. The meter here is the MFJ259B.

Would be good to hear from more folks to build up a picture and see how
consistent it is. Sounds like 1-bar=1.5:1 (or less) is about right.

I remember your TH79A experience, which related to a feature not being present.

The only controls on the stick mobile rig I can remember is one made by standard. It was nice in that you didn't have to put any holes in the vehicle. Unfortunately, it did not live up to the Standard name of high reliability, as two hams I know who don't abuse equipment had the controls fail. You also had 4 levels in the menu to get to volume, where at least a knob for volume and squelch would of been nice.

If you read Dilbert, he had a strip about scheduling recently, where the schedule was artificially set based on trade shows. Clearly Kenwood had to show something.

3422. Quick Mobile connect/disconnect

From: Rick Koch
Topic: 3422 Message: 3422

Does anyone know of a bracket that one can mount a mobile radio,
such as the ft-100, in which the bracket connects to another
bracket providing a quick connect/disconnect? These brackets
would have mating connectors for pwr,spkr,antenna(s), and misc.
I am thinking about making one (or two) so I can quickly
mount/dismount my ft-100 for use as a mobile or base station.

Tnx,

Rick/N1GP

Topic: 3425 Message: 3425

I guess I should have explained a little farther the equipment I was using to measure SWR and probably shouldn't have included the faulty readings from my MFJ meter. I was using a $20,000 Hewlett Packard network analyzer that I use for work. I test and troubleshoot coax and antenna systems for cellular (800-900MHz) and PCS (1.8-2.0GHz) carriers. I'm not putting down the MFJ 259B SWR analyzer, it's a great tool for troubleshooting antenna systems. But the type of question that was asked requires equipment with a little more accuracy.

The readings I got with the HP seem to correlate with Yaesu's findings about the sensitivity of the the FT-100 to SWR. According to page 12 of my manual, the protective circuitry starts to reduce the power at an SWR of about 1.5:1. I find that my rig starts to cut back on power at just over 1.6:1.

I'm in the process of doing a mobile install as well. Had the FT-100 on my bench, checked it in all modes, all bands....no problem. It sat for two months hooked to my BBS running a 9600 baud link (excellent 9600 baud performance I might add) , and yesterday it went in my truck. The oscillation problem showed up immediately on 12, 10 and 6 meters. Like Scott, I had my speaker mounted away from the radio, behind my head. So I tried the ferrite trick on the extension cable for the speaker. Unfortunately, that failed to cure the problem.

So back through the archives to find the info on the grounding problem on the filter board. Looking inside the radio, I too had the copper strip from J1015 to the chasis. I used a small piece of copper braid from RG-58, and very carefully tinned it, formed it and soldered it in place. That cured the problem.

It takes about an hour from the time you open the radio to the time you button it back up. For those that have to go this route to solve the problem, work slowly,
methodically and patiently. If your'e unsure, send it back to Yaesu and make them correct the problem.

I had a problem with the Yaesu service center back around 1991 or
1992. I sent my FT-727 dual-band HT to them 7 times in the course
of a year. Everytime the radio came back, it had the same problem.
The last time I sent it to them, they replaced the guts of the radio,
but didn't want to admit they did it (I knew because I had my callsign
engraved on the side of the metal chassis and it wasn't there the
last time I got it back). I told people I would never buy another Yaesu
radio.

Well in the past 1 1/2 years, I've bought a new FT-100 and VX-5R
and I bought a used FT-290R II and FT-690R II. If I could find a used
FT-790R II for a decent price, I would probably buy that so I could
have all 3 radios in that series.

What you really want to know is at what serial number break point does the FT100 not need to go back to Yaesu for upgrades. [I gather from this list the units that Yaesu is fixing are now worthy of buying.] Probably any FT-100D won't have these problems since the stock is fresh.

I have to say this in field beta testing by Yaesu really gets me PO'd. Yes, I have Yaesu equipment, but I always wait until the bugs are out (FT50), or just avoid the product if it never gets fixed.

You would have to assume that whatever mods Yaesu is making to FT100's in the field are already present in the FT100D that you find on the dealers shelf. Unless Yaesu indicates where the serial number break-point is on the FT100, I will only consider the D model when my new truck arrives. If there is a post that the D model has funny SWR problems requiring barrels and extra-coax to reduce, I guess it's time to look elsewhere.

Topic: 3430 Message: 3436

I was also at Dayton and talked with the Yaesu staff.

The difference is that they have added the filters and CTCSS decode which many hams do not like to open up the radio to put in. The speaker is larger and the top case is raised in the speaker area. Not a flat smooth top on the "D" model.

The new price is the same as the old price plus the cost of the filters and CTCSS decode unit. Street price about $1249.95 for Ft-100D, Dayton price for FT-100 was $949.99 plus the additional filters/CTCSS items equal the same dollar amount.

As for radio failures in the past there were many (was told about 10%) in the first runs of the radio. If you have looked at any of the boxes in a dealers stock you will see up to three different colored stickers on the end of the box near the serial number. Was told "that is modes done" which I assume was to correct early run problems. I bought mine in July of 1999 and have worked it rather hard since then. Yes, I wanted to buy one in Feb. of 1999 but choose to wait for problems to be corrected.

As of this time I have not had any problems with it and it has never been sent back. The key for me is never turn it off while warm, I will get out of my vehicle and just turn the volume down if I have been talking and the case is warm. The fan will do the job it was designed to do if you leave it to cool down on HF but they do run hot if left on VHF/UHF as the fan has a differnt cycle time. I have run with a Comet 360B diplexer for separation of HF and 6M to Halo and separate dual band antenna for VHF/UHF. Just bought a Atlas-100 to update from my Hustler coils and mast. Also have tried a screwdriver and that in not my idea of fun while driving at freeway speed and tuning for change of bands.

73,
Bob KA6LSL

Can anyone else comment on this "sticker = mod done" logic?
Does anyone have any idea what mods are done?
I have all three stickers on my box (blue, gold, green) so I am
assuming three mods, however, I only know of one that people have
reported here on the list (The ground to the frame from J1110, (yes,
I know I got the number is wrong)))

What do the other two dots signify?

I hope everyone is enjoying their weekend.

Topic: 3439 Message: 3439

Hi All -

I got my new FT-100 installed in my F-150 truck about 2 weeks ago but am only running 2M & 440 at this time. I had to mfg. my own mount for my ATAS-100 antenna and I will probably be finished with it early next week.

The Rig works great but I do have one troublesome quirk with the rig. I have the AM-6kHz and the CW-500 Hz filters installed by AES. I tried to work in CW mode on 2 Meters today for the first time and while on the 2.4 filter it worked just fine. But when I kick in the 500 CW filter it is a different story. With this filter the rig does a wierd thing: when I key the rig I hear a "click" when I release the key. It does it only with the 500 Hz filter and it doesn't matter whether the keyer is on or off. I almost sounds like a repeater "tail" when I let up on the key. DSP helps but there must be something either set up incorrectly or there is a problem with the filter. I have the rig setup with FULL break-in. When I set it up on Semi-break-in I still get the "click" when the rig goes back to Receive mode.

Does anyone here have any ideas what is going on? Any help will be much appreciated!

Thanks -

I bought my 100 in April of 99 and it had all those stickers (they are
simply inventory destination stickers) on it. It went back to Yaesu
twice.

You were told wrong.

Hi there

Having problems getting the FT100 to work 9k6 packet using a TNC2H-DK9SL Symak modem.

Seem to receive data and my sysop can connect to me, but my TX data does not want to be recognised by the node. Have had a connection, although poor and slow to another node.

I have set up as per manual and using Digi mode and also set menu 28, AFSK level to 100 as mentioned in some past mailings.

Any suggestions please.

Also, anyone using a TNC2H, what DIP setting have been founf to be suitable for the G3RUH TX filter curves?

Is it 2.5 or 5k deviation setting required?

Thanks
Richard, G0EWH

Hello,
I use the same configuration....
on TNC from left to right 123 up and all other switch down
On FT 100
settting 34 pct-f
37 9600
38.....2125
39.....2125
I problem at the beginning was same because I used a duplex digipeater and
with the split memeory I used to store the rx-freq. with DIG mode but not
the TX-freq. After finding this problem everything works fine.
I can go down to txdelay of 2 for my digipeater. But TXdelay time will be
one of the best reasoons to find the problem for no connection....
Best regards
Hanno, DG8JZ

I guess the question that is begging to be asked where in 70 cm were you trying to tx? Rg will not TX below 432.000 in any mode without doing a "hard" conversion on it. ATV segment of 440 will then be available on the FT 100.
Good luck,

Gee, Dick, it depends.

Are the dots on the sides or the top or bottom?
How are they placed relative to the front and back of the box? Top and bottom?
Are the dots oriented in a particular manner or configuration?
Are the dots individually pointing in any general direction?

All these have special meaning and are known only to the folks at Yaesu.

But, they are all important questions that demand answers.

Goodness knows, the folks at Yaesu have been keeping way to many secrets from the consumers.

It's just another darn conspiracy against us.

3456. New FT-100 with CW problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-29 17:55:26 UTC
From: ad6ez@aol.com
Topic: 3456 Message: 3456

Hi All -

This is weird! I sent an email requesting feedback regarding an FT-100 problem that I am experiencing with my new rig and I got only one response! Must be a holiday weekend! BTW - hope everyone reading this is having a great weekend and taking the time to think about all those that gave so much so that we can enjoy everything we have - especially our Feedom!

So here goes again: I had the AM-6kHz and the CW-500 Hz filters installed by AES. I tried the rig in CW mode on 2 Meters and 440 for the first time and while on the 2.4 filter it worked just fine. But when I switch in the 500 CW filter I hear a "click" or squelch "tail" when I release the key. It does it only with the 500 Hz filter and it doesn't matter whether the keyer is on or off. It almost sounds like a repeater "tail" when I let up on the key. In other words, I hear that sound at the same time that the Red Transmit LED goes off. DSP helps but there must be something either set up incorrectly or there is a problem with the filter. I have the rig setup with FULL break-in. When I set it up on Semi-break-in I still get the "click" when the rig goes back to Receive mode.

Does anyone here have any ideas what is going on? Any help will be much appreciated!

Thanks -

Dale
I put a 300 Hz filter in mine because I use the rig mobile, but lets get to the problem;
Some where in the set ups u can select a relay click mode try disabling that, the next option is to disable the agc or try a different agc action. The only other idea that comes to mind is the electronic switch the brings in the filter isn't quick enough.

I am looking at TRX-Manager... www.trx-manager.com, its $65 shareware, they have a limited demo. So far looks like the friendliest, plus it will do most any of the CAT capable radios, allowing one software to do any radios you might have. Or multiplex them! As my radio is in the mail, hard for me to say how well it works, but the hands on the software feeling is good.

For a logging program with rig control, there is the easy to use and freeware XMlog... http://www.xmlog.com/ . Its really neat, load you favorite Dx Cluster, click on the DX as it comes in have the radio go to the frequency, the rotor turn your antenna towards the DX and the log filled out!

Good DXing,

3461. Possible ATAS-100 problem.

Yahoo group: FT100 (1998 — 2000)
Date: 2000-05-30 14:50:59 UTC
From: Stephen Mitchell
Topic: 3461 Message: 3461

I recently installed an ATAS-100 on my truck and I've
noticed something that kind of bothers me and I need to
find out if it's a characteristic of all the ATAS-100s or
if mine is faulty in some way. I hope I can explain it.

I've noticed that while driving at freeway speeds that
sometimes the antenna won't go up or down, but that's
not a real big deal. What is a big deal to me is that I've
also noticed that at freeway speeds signals "click" in and
out real quick or if I hit a bump they'll disappear momentarily.

I think I've found the cause of this. I've found that the base
of the "stinger" or whip section where the set screw is located,
just above the rubber boot, wobbles just a little bit. At freeway
speeds, or when hitting bumps, the whip moves causing the section
to move or wobble causing quick intermittent contact. I would
like to know if anyone else has noticed this and if this is just a
characteristic of all the antennas or if something is loose on mine.
I didn't notice this problem when I first installed the antenna
but then I didn't get to play with it very much until my road trip
this last weekend.

Thanks for any help.

Speakers Again,
Listened to the Clear Speech Speaker at Dayton. Save your money and buy one or get the Clear Speech Base unit and use it with the ol' two dollar Motorola speaker. The Digital Processed Clear Speech Speaker really will reduce listener fatigue. A couple friends bought them at Dayton and are pleased.

Key the microphone and press the UP button ON THE FT-100 FRONT PANEL for a
couple seconds.

Tune the rig to ten meters (any lower frequency will work) then hit the
TUN button ONLY.

TRX-Manager also does logging, has a DX cluster connection built in (click and you're there); CW and voice macros; rotor control...it's very nice. I think I only paid $55 (it's from France, so the currency exchange will determine the actual cost).

The log uses a Microsoft Access database, so it's easy to get at for your own reporting if you use Access or VB. It runs the FT-100 very well, and is pretty easy to use. Well worth it to me.

Just installed the ATAS-100 on my pickup too. It's a '90 Toyota King cab. I have always been an advocate of drilling and mounting antennas directly in the center of the roof, for height and counterpoise reasons.

In my case, I drilled a hole directly in the middle of the metal. I reinforced the stock metal with a large washer underneath, and ground the paint off to bare metal as well as used copper impregnated silicon grease for conductivity. I have had excellent results and none of the counterpoise problems others have had. I have been able to tune on all HF and VHF/UHF bands with no problems. I do have some noise from the coil/ignition, perhaps more than I would have if I had mounted farther back, but that would be the only downside I have seen.

Logic 5 when integrated with TRX-Manager works great. The 4800 Baud Interface of the FT-100 results in slightly less than real time computer tuning (with the Virtual Tuning Knob) but that feature is mostly glitz anyway. The best features are the sliding tuning knob (rapid changes through the entire tuning range), keyboard frequency entry and (with some creative manipulation) the ability to save and retrieve the memory blocks.

TRX-Manager runs as an add in to Logic 5 or independantly. You can check the features of each at www.hosenose.com

I have installed the ATAS-100 on the hood lip opposite the broadcast antenna
on a 1999 Expedition with NO problems. Also I intend to do the same on a
customer's 2000 F150. I do like the bed post idea if you can do it though.

On a truck that old you may encounter ignition noise. I would suggest
suppressor wires and a new cap (as in cap-n-rotor) but see how it goes.

GROUND, GROUND and then reGROUND the antenna and mount.

> Rocky,

Just a thought.... I don't know if you want to garage your truck or not and how vertical clearance is in your area, but let me share my idea with you. I have the FT-100 and hope soon to mount the ATAS-100 (when I get one) on a fiberglass tonneau cover I have over the pickup bed. I have lined the underside of the tonneau cover with aluminum tape (one roll, about $12 at the Home Depot). This took a few hours since the tape is only about 3" wide and you want overlap. The resistance from one end of the tonneau to the other is very low. If vertical clearance is not a problem, you could do
something similar with your fiberglass shell. I haven't mounted the antenna yet, but I plan to mount it in the center of the cover with a bulkhead feedthrough connector. It would get your antenna up in a prime (for mobile) radiating position and away from curious hands. When I finally get mine mounted, I'll let folks know how it works.

3479. Fans on UHF/VHF

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-01 09:39:09 UTC
From: Mike Ketchum
Topic: 3479 Message: 3479

Some time ago I read on this list about some fan settings that the FT-100 has. I can't find it in the Archives and was hooping that some one could help me.

I was hoping that I could change some settings that would allow the fans to run more often while the radio is in the VHF/UHF mode. I would much rather have a noisy radio than a hot one. If there are any software/setting adjustments, that would be great. Actual custom electrical modification to the radio is not an option.

Thanks,
Mike

Joe,

Good idea !! I have a Daihatsu Off Roader with a plastic resin lid on the cab and a plastic resin roof at the rear. Currently use a gutter mount that is not the best configuration with the ATAS100. The only metal above my head is a roll bar that is a twin walled box section that I do not feel inclined to weaken !

I had planned to line the cab roof (actually a removable sunroof section) with aluminium cooking foil glued on with PVA. Or cut and fit a sheet of thin aluminium and bolt this thru' with a 259 bulkhead connector. At least it won't go rusty and ought to perform better than steel.

The cab roof area is about 3'6" by 2'. Do you learned subscribers think that that area is big enough ? It will of course be bonded to the rest of the vehicle. Rarely use the sunroof because we rarely see the sun in the UK !! So no problem there.

Andrew G3OUT.

PS Apologies for the spelling of that lightweight versatile alloy created from bauxite !!
PPS Don't forget that most antenna connectors are made from brass and although plated do not get on very well with that versatile alloy created from bauxite particularly when wet !!!

3481. More mobile HF results

Yahoo group: FT100 (1998 — 2000)

From: Dan KN6OL
Topic: 3481 Message: 3481

I have the ATAS-100 mounted on the roof via a drilled hole.
Grounding is excellent, so tuning had minimal problems.

I found though, that when my vehicle was parked close to the house,
thereby close to the rain gutters on the roof line, the interferring
metal caused some TUN anomalities. Although others may not have
the "Rain gutter" effect, similar effects may be experienced from
adjacent metal from the vehicle or other closly mounted antennas.

I found that the antenna would TUN fine, but subsequent transmissions
would cause high SWR readings. Again, moving the vehicle away from
the metal causes this problem to go away. The solution, as many
others have previously pointed out, was to add (in my case) a 3 foot
section of coax inline. All TUN problems went away. I didn't leave
this in place, since I don't park close to the house and transmit any
longer.

3482. Where does the ATAS-100 radiate?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-01 16:34:12 UTC
From: Dan KN6OL
Topic: 3482 Message: 3482

In considering a mounting location for the ATAS-100, how much of the antenna would you want to be above any metal? If only the whip radiates (or at least radiates 90% of the energy), then the 1.5 foot black base section could be mounted below the roof line without serious degradation of performance.

I may play around with this myself if others haven't yet.

Any thoughts?

73,
Dan, KN6OL

Topic: 3483 Message: 3483

The ATAS 100 radiates from almost the base on up. It is best mounted on the top of the horizontial "ground plane" with the antenna at 90 deg. to the ground plane. If you have to mount it down along the body of the vehicle, less is better. Mount it as far from the vehicle vertical portion and hope. The impedance and patterns are best with it in the center of a roof and degrade from there.
I have mounted mine on the roof of a suburban and blazer and it tunes great on both. The motor home with only a partial metal tube frame took foil on the roof (2 about 0.5 X 4.5 ft sections) to make 6m and 2m look good. Also noticed some RF on 15M trying to sneak down the coax shield. A clamp-on ferrite section took care of that.
I do like this system!!

3484. MMB67 YAESU QUICK RELEASE BRACKET

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-01 18:14:28 UTC
From: Dan KN6OL
Topic: 3484 Message: 3484

Has anyone seen/used the MMB67 YAESU QUICK RELEASE BRACKET?

What exactly is this device? Is it some type of mounting bracket for the FT-100? Does it include something that allows quick removal of the YSK seperation cable?

I love the radio enougn that I would like to be able to move it to the house more easily.

Thanks,
Dan, KN6OL

3485. Quick release Bracket

Yahoo group: FT100 (1998 — 2000)

From: Erwin
Topic: 3485 Message: 3485

It just that, a quick release bracket, no cables. It replaces the
fixed "U" bracket that comes with the radio. It consistes of 3 parts,
2 bolt on side plates and a plastic edged plate the brackets slide
into when they are screwed to the radio.
Works well but is pricy for what it is.

MMB67 is a replacement for the regular mobile mount. It consists of three pieces. Two "wings" and a u-shaped piece that attaches to where ever you want to mount the radio. The "wings" slide into grooves in u-baracket and are friction fit. It hold very well.

It doesn't disconnect any of the wiring.

Date: 2000-06-01 19:35:45 UTC
From: Jim McGhee
Topic: 3486 Message: 3487

Hi all,
I am very disappointed with the MMB67. I thought it would allow me to
easily
move my remotely mounted FT-100 from the trunk of my car to my house.
NOT!!!
After removing the two antennas, the speaker extension cable and the
mike cable
(not too bad, so far) you still have to find a very small screw driver
and remove
two very small screws to remove the remote cable. If you drop one of
these small
screws, you will never see it again and the remote cable is useless
without both
of them. The IC-706 I had didn't require ANY screws to attach the cable
to the
radio.
I love my FT-100, but this sure is a DUMB, CHEAP way to do this.

OK, I feel much better now.

>
I can't answer your other questions, Dan. But, trying to move the radio configured with the separation kit into the house might be problemmatic. Those little screws will kill you taking them off/putting them on, especially when the unit is in the trunk and there's not much of a service loop to the cable. Also, you are going to have to do the same with the remote head.

> I love the radio enougn that I would like to be able to move it to
> the house more easily.
>
That being the case, I'd forget completely about using the separation kit and find a way to mount the radio in it's entirety so you can unmount/mount and disconnect/connect it easily, comfortably, reliably and with minimum wear and tear on cables, connectors, etc.

This sounds good in principle, but getting a good quick connect for RF will probably be a problem. If you look around flea markets, you can find RF patch bays. You should only buy them if you get the male and female at the same time as many look similar but do not mate. In the case of the FT100, you only need two patches, which should be under $10.

Dan,

Maybe I missed this, but how much coax, what kind, and are you using the rig remotely mounted or conventional dash area mount?

ATAS100 Users ~~~~~~~~~~~~~~

I may have found the cause for this intermittant action of the antenna.
I recently experienced this intermittant problem and upon disassembly
of the antenna (found an explanation on how to do this in the archives!)
I found the top wire of the coil that is captured in the whip base piece
had broken.

At the bottom of that piece is another set
screw (hidden by the rubber boot) for the top wire from the coil. The base
piece simply unscrews from the top of the coil form. So if you unscrew
it without loosening the set screw for the wire from the top of the coil,
you will break that wire. It's possible the piece will unscrew slightly
just from normal use and allow the whip to flex it too much resulting
in the broken wire.

Anyway, I carefully unwound the top coil turn, and threaded it up to
the base piece with the set screws and made a new connection.
I thought I would be back in business and enjoying the rig and fine
antenna again. WRONG

I still had some intermittant action, and it seemed to be worse in
some tune positions. In other words, it would appear to be worse on
40mtrs than 20 ... Hmmm - thinking cap goes on ..... I know, no wise
cracks.

That told me the connection to the coil by the slider action wasn't making
good connection in certain locations of the coil. So I disassembled the
antenna again and took a good look at that part. The slider connection
is made by 4 ss balls held against the coil by two metal fingers. Upon
disassembly of the fingers, I found they are not made of spring steel
like you would think. Instead they bend easily and could be broken easily
too. I reformed them (carefully) to put more pressure on the coil and
reassembled the antenna.

Now it seems to work without any intermittant problems. YES! But, I
suspect the problem will need to be fixed again in the future ...

Good luck and be careful with your home brew fixes.

Hi
I have just purchased the Addonis Fx10 hands free kit
Does anyone know the wiring pinouts on the 6 pin Ft100 modular plug to this hands free kit?
I now need to fit the plug to kit??/
Thanks for info
John

Suggestion - Return that unit if you can. Pryme has a new unit out an adapter for the FT-100.

See note below, I just received from them:

Yes, it will work the FT-100. The proper cable is the PCA-Y100.

Ken Collier, KO6UX - Marketing Manager

Dave,

If you missed it, it's likely cause I wasn't specific enough.

My rig is remotely mounted. Since it wouldn't fit in the dash, I installed the unit under the rear seat of my toyota king cab pickup. The head is remotely mounted using the YSK to the dash, and the mike connector is in the center console.

I used the Comet SO-239 mounting kit with the standard length of coax (I think it's something like 15 feet of RG8X). The length I added to play with was 3 feet (simply because that's the length of patch cable I had laying around) also of RG8X. I connected them together using a PL-259 barrel connector. I might add that the 15 foot section of cable that came with the mount is about 4 feet too long. It's possible that removing some of this would yield the same results. I only saw problems when the antenna was located near metal.

I might add that these are the steps I took to mount the antenna:

1) Removed the interior dome light. I have a sun roof, and the light is located directly aft of the glass. I selected a location about 6 inches aft of the sun roof, which is about 15 inches forward of the back of the truck roof.
2) I placed a piece of wood between the interior ceiling liner and the exterior metal protecting the liner from the drill.
3) Using a hole saw, I drilled a 5/8" hole from the outside of the truck.
4) Using a die grinder, I removed 1/2" of paint sorrounding the hole on the INSIDE of the truck roof. I then coated this exposed metal with conductive grease.
5) Before installing the mount, I added a 2" diamater washer, with a 5/8" center hole, coated with more conductive grease to the inside of the truck roof. This was done to add strength to the thin metal roof. I was concerned that the roof might buckle under heavy load either from wind or accidentally whacking a tree while moving.
6) Installed the mount from inside the truck, added the exterior tightening ring, and tightened it down as tight as I could without breaking anything.

In all of the above steps, good grounding was my primary concern. I also grounded the radio to the chasis by removing paint from the car metal where the bracket was mounted and removing paint from the bracket itself. I believe strongly in good grounding, as it is critical to both, good tuning counterpoise as well as

ignition/alternator and other noise sources.

Having done all of the above, I was able to tune on all bands 440 through 40m, including WARC bands, with no problems other than those seen near external metal objects.

In my vehicle, I added 6" - 12", 3/4"wide, braided grounding straps to many points on the car including"
1) Hood to car chasis
2) Engine block to car chasis
3) Battery negative to car chasis
4) Muffler to car chasis
5) Air filter to car chasis.

All of the above are excellent radiators of ignition noise. My vehicle has conductivity in the above list, and in some cases, even a small grounding strap already. I believe that a short, wide, flat, braided cable is important in grounding. Using a thin or round cable to ground only adds to the radiation problem by creating an antenna.

Abe,

I used some copper impregnated silicone grease that came with my
butternut HF verticle. I hear that you can get a variation of this
stuff at your local home center (Home Base, Home Depot) and it's
called something like Die-Ox (complements of Tom, KA6K).

Date: 2000-06-02 15:43:18 UTC
From: aschach3@csc.com
Topic: 3498 Message: 3500

Dan,

Thanks - I'll make a stop a Home Depot this afternoon.

73,
Abe Schachter N3BBF

3501. FT-100 Net/Sched

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-02 15:50:36 UTC
From: Dan KN6OL
Topic: 3501 Message: 3501

Been thinking,

With all these FT-100 and ATAS-100 users out there, wouldn't it be kind of fun to have some weekly HF net/sched?

It would be kind of neat to hear everyone in their mobile and base FT-100 installations.

Something like Saturday or Sunday evenings somewhere in 17 or 20m bands.

Any thoughts or am I just crazy?

73,
Dan KN6OL.

3503. New poll for FT100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-02 16:21:24 UTC
From: FT100@egroups.com
Topic: 3503 Message: 3503

Enter your vote today! Check out the new poll for the FT100
group:

FT-100/ATAS Owners. What is your
installation?

o Single ATAS antenna with Duplexer
o Single ATAS antenna with Switch
o Dual antenna (ATAS and VHF/UHF)

To vote, please visit the following web page:

http://www.egroups.com/polls/FT100

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the eGroups
web site listed above.

Thanks!

I believe this is the grease you use to connect copper to Al in house wiring. That would make the explanation to the dude at Home Depot go faster.

Abe,

I used some copper impregnated silicone grease that came with my butternut HF verticle. I hear that you can get a variation of this stuff at your local home center (Home Base, Home Depot) and it's called something like Die-Ox (complements of Tom, KA6K).

I kind of like the idea. I have yet to talk to another person on
HF that is using an FT-100 as well. I'd like to hear what one
sounds like from the other end.

They have nets for everything else, why not an FT-100 users
net?

> Andrew,

In my original post, I forgot to mention that the aluminum (aluminium for those whose callsigns begin with 'G') tape is self adhesive. It is commonly used for heating, ventilation, and air conditioning (HVAC) ductwork and is much more durable that the more common cloth duct tape. The toughest part of the whole project is removing the backing from the tape since I cut each strip to the proper length to check the fit before removing the backing and installing it. You've got to get your fingernail (or a sharp object) between the aluminum tape and the backing to start the peel. The adhesive is quite good and stands up to moisture and temperature cycling. I've had some on my house ductwork since 1986 and it is still in great shape. The tape on the underside of the tonneau cover has been in place for about 6 months and shows no sign of deterioration. It can be easily removed if desired with no damage to the underlying surface.
As vehicles start to be made of more and more plastic, resin, composite, or what have you, we hams will have to become more creative in creating counterpoises for our mobile antennas. I have it on good authority that the Detroit manufacturers will be making pickup truck beds entirely out of non-metallic materials within just a few years. This will eliminate the need for plastic bedliners (for those who are so inclined) in addition to eliminating grounding paths. I'd imagine that the use of substitute materials will escalate from there.
As far as the 3.5' X 2' size of the roof being large enough ..... well if that's what you have that's all you can get. If you bond it to other sections of the vehicle I would expect it would work well enough. BTW, you can use the aforementioned aluminum tape to make the bond. If there is movement between the sections to be bonded you could leave a small service loop; however, loose sections of the tape are subject to damage as it is only a few mils thick. The adhesive is conductive so that is helpful.

Is the adhesive side of the tape a good conductor? I might be
concerned that the adhesive may insulate the metals.

I've used this DieOX on home made antennas, since any antenna made out of Al must ultimately connect to copper. However, I don't know for a fact that it is made up of copper in grease. If you really want a product designed for such applications, I would at least investigate Calilube from Caigs. You want this version: CaiLube M260CP & L260CP: Contains copper particles for breaking up oxides.
http://www.caig.com/c-cl260.htm
If you make an order, get some Deoxit as well. This is a great contact cleaner.

I've bought my Deoxit from:
http://www.arcade-electronics.com/caig/caig.htm
Their prices are slightly better than ordering from the factory.

Subject: RE: [FT100] Re: More mobile HF results

I used some copper impregnated silicone grease that came with my butternut HF verticle. I hear that you can get a variation of this stuff at your local home center (Home Base, Home Depot) and it's called something like Die-Ox (complements of Tom, KA6K).

3511. Re: MMB67 YAESU QUICK RELEASE BRACKET

I had put some thought into this a couple weeks ago.
I found some Motorola RF connectors at Radio Shack
(used in automobile AM/FM radio/ant's) that looked
like they'd be perfect for the task. RS had both
inline male & female connectors.

A viable quick disconnect cable for the FT-100 might
consist of 2 Motorola RF conn's, and a 6 pin Molex
(for power & speaker).

You could make 2 mating cables for it. 1 in the home
shack and one in the auto.

This and the MMB67 might fit the bill?

3512. Vehicle Ground Planes

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-02 17:46:12 UTC
From: Andrew Walker
Topic: 3512 Message: 3512

I can confirm that aluminium cooking foil stuck (with double sided tape) to the underside of a glass fibre resin roof does indeed work with the ATAS100. On my vehicle at least.

I have bonded the lot to the vehicle chassis with 6mm stranded copper wire and apart from my problems with instability on 12 and 10m (going back to hospital on Monday !) works very well. Even heard some Italians on 6m romping in. Can only push out about 70 watts on 6 tho', but the SWR Icon stays off.

Have also noted that when the ATAS is tuning, the Antenna Icon on the display actually tells you which way the antenna is moving if you look carefully. Also when tuned, the SWR Icon shows a zero rather than a cross next to it. Does this mean zero reflected power ?? Also tunes without problem on 10, 18 and 24 mHz although a bit critical. Will also retune as you change frequency on 7mHz.

We are getting there at last ! I will keep it !

I kind of like the idea. I have yet to talk to another person on
HF that is using an FT-100 as well. I'd like to hear what one
sounds like from the other end.

They have nets for everything else, why not an FT-100 users
net?

From: Michael Jones
Topic: 3514 Message: 3514

Ack, only three choices and none of them are appropriate for me.
ATAS for HF-6m on the HF-6m port
Diamond Duplexer on the 2m/70cm port
Pair of 70cm HO-Loops on the 70cm duplexer port
Pair of 2m HO-Loops on the 2m duplexer port

Mike

I chose 'Dual antenna' for the pole.

From: gerald.kopstein@us.ul.com
Topic: 3518 Message: 3518

New to this exchange, but like the useful info that is flowing. I'm planning on getting the Atlas and mounting it on the hatch back of a Pontiac GrandAm, only because I need to get the vehicle from Illinois to California for daughter who is going to school there. One way and probably never to be on there again.

First, will it work that way - trunk mount that is. Suggestions on what trunk mount to buy? Cautions?

Thanks in advance.

Of course that is if I get my rig back from Yaesu. I noticed nobody on here stated they have had any major problems with the FT100. Mine after about 4 weeks caught fire upon hitting the 'on' button.

Jerry - N9AC

I just use a comet trunk lip mount, I have moved it from retal cars to my own and
have not had any problems. I have not had to run extra grounds, attach body parts ect.
I just run direct power from the battery go to a CF530 comet duplexor and the ATAS 100. No fires !!

3521. FT100 15kHz FM-filter

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-02 21:03:36 UTC
From: Peter de Blecourt
Topic: 3521 Message: 3521

Hallo everyone,

Am reading all those messages about FT100 and ATAS.

Just want to talk about an other subject of the FT100.

I'm using the FT100 now for two weeks.

Is there anybody who has information about a smaller FM filter for the FT100 ?

In Europe normal frequency steps are 12,5 kHz. At strong signals I hear +/- 12,5kHz still this signal (splashing). I like to have a smaller FM filter, for example 12kHz.

Anybody ????

Lots of suc6 playing your FT100.

73, Peter de Blecourt PE1MXV (soon change of call, cause of result CW-test)

3522. Alum tape ground planes

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-02 23:07:07 UTC
From: Erwin K6RCX
Topic: 3522 Message: 3522

Hi Group,
Just a note for the folks using alum. tape for ground planes. The stickum on most of the tapes is semi-conductive or in some cases resistive. We have used tape for years as part of antenna pattern and radar cross section models. If you do not have a "large" overlap for capacity between strips the junk can be lossy to RF. Just think about all those carefull joints you have been making to mount the rest of the antenna !!

Great. There seems to be some interest, so let's take the bull by the horn and start something.

I wasn't thinking of an official net or anything like that, just a simple group QSO session.

Having heard no arguments against it, this will be the 1st shot:

Sunday, 09:00 UTC (4:00 Pac, 5:00 Mtn, 6:00 Cntrl, 7:00 Estrn). This should leave some daylight for all timezones, and hopefully along with that some propagation.

On the hour, we will try 18.140 MHz.
If busy,
5 minutes past the hour let's try 18.150
If nothing,
10 minutes past the hour, let's try 14.240

Both of these bands are pretty busy, especially during the day, so finding room may be a challenge. Perhaps we could even interrupt anything going on to QSY somewhere. I tried to pick something in the General area that should allow for all of us. Perhaps it makes more sense to move to 12 or even 10 meters too.

Let's try this out on Sunday, Jun 4, and hope for the best. If after all those attempts we don't make it, we can try something else next weekend.

Here are the responses that I've seen so far, along with 1st name and state from the call book. This may assist in identifying some of us who make it. I'm sure there will be more, so if all agree, I'll keep this list updated to help those of us who are like me with no memory capacity.

Mine is a trunk mount, on a 1985 ford thunderbird. It works great. Does the grand am have a metal trunk? If so, may well be just fine.

Subject: [FT100] Atlas use on hatchback

New to this exchange, but like the useful info that is flowing. I'm planning on getting the Atlas and mounting it on the hatch back of a Pontiac GrandAm, only because I need to get the vehicle from Illinois to California for daughter who is going to school there. One way and probably never to be on there again.

First, will it work that way - trunk mount that is. Suggestions on what trunk mount to buy? Cautions?

Thanks in advance.

Of course that is if I get my rig back from Yaesu. I noticed nobody on here stated they have had any major problems with the FT100. Mine after about 4 weeks caught fire upon hitting the 'on' button.

The net sounds good and I'll be there if I can solve a little problem.

I've had my ATAS-100 installed for two weeks now and I've gone through two of the antennas. The first one became flaky with an intermittent contact within the rubber boot section.... probably a loose ballbearing or not enough tension in the spring. Before I found out what the possible cause was, HRO let me use their in store demo to see if I had the same problem... which I didn't. However, this evening on my way home from work the antenna refused to move up OR down so now I have to determine if the problem is the tuning circuit on the radio or if the problem lies within the antenna. Should be pretty easy to figure out... just go retrieve my old antenna from HRO and try it out.

However, this problem I seem to be having with ATAS-100s has got me wondering if I should try a different antenna, not because the ATAS-100 is junk but maybe with my installation vibration and wind may be causing premature "death." With that I'm wondering how many users out there are using or have used an Outbacker antenna and could tell me something about them. Like what kind of bandwidth you got out of them and do you have to adjust the stinger each time you move to another band and move the wander lead.

I'm hoping that HRO will be willing to refund my money so I can get the Outback if I decide to go that route, if not we'll just get the antenna fixed. It's possible their store demo was faulty when I got it.

I'll be listening !! Very civilised hour on a UK Sunday.

Do not overlook the fact that some of our FT100's don't like 12 or 10m !!
Could try 6m, has happened before !!!

I'm up for a good FT-100 sched, but 2am PDT is a bit of an odd hour for daylight. You sure you don't mean 2100UTC? aka 2pm PDT or maybe2300UTC 4pm PDT. Too many unknowns...verify the time and I'll try to be there no matter which time.

Mike
KF6SWI

1st FT-100 in CA, 2nd FT-100 Failure, 1st FT-100 at Yaesu service...couldn't miss a 100 sched!!!

Have been using the Outbacker Perth Plus on 75-10 meters since May, 1999 and I have really enjoyed the performance. I did add however the little MFJ Mobile Matcher to somewhat fool the FT100 that the SWR was flatter for a greater bandwith on the antenna. It has successfully fooled the FT100's SWR fault indicator circuit. I can use the antenna on virtually all the SSB portions of the bands which is where I tuned the antenna for. I have not been CW mobile yet but plan to in the future. As for the stinger, set it once and that's it for all the bands. The fly lead is of coarse the band changing mechanism. When I change the fly lead and bands, depending on which band I am operating I might also have to change the mobile mini matcher switch also. I did have to add a 5 foot length of coax to the original Diamond coax for the mount to get over the 10 meter typical FT100 SWR issues. All working fine. I use a 6 meter stick with a 2MHZ bandwith for that band and have not used the Outbacker for either 6 or 2 meters. Would like the functionality of auto band change from the drivers seat, but I live with this one because of the fine performance. Have had some thrilling contacts on 20 ssb with this set up mobile. Best I've ever done with a mobile installation. The key to success with rig is ground, ground, ground!!!

Have fun!!

Leave it to me to screw something up. I do mean Sunday evening
though, which is:

16:00 Pac, 17:00PM Mtn, 18:00PM Cntrl, 19:00PM Estrn.

I think I subtract 7 hours for UTC here in the Pacific, so 16:00 - 7
is 0900 UTC. I think the error I made was not using 24 hour notation
for the time zone. Sorry, but I did intend to mean 0900 UTC.

Grounding isn't an issue. I have the radio and all parts of the truck grounded to the frame and the ATAS-100 (when it works) tunes fine. I just seem to be having a problem finding an ATAS-100 that is sturdy enough to handle freeway speeds. The darn screwdriver mechanisim seems to lossen or the thing just doesn't want to move up or down. With the second antenna (refusing to go up or down) I have a suspicion that it might be the radio's tuning circuit and not the antenna.

I'll soon find out.

Ok Ok, I went to the http://www.time.gov/ page, and figured out that I needed to add 7 hours, not subtract. I think that's the error of my ways (although at this point, I wouldn't swear to anything).

That would seem to imply that 2300 UTC is when we will give this a try. Any contentions?

I have a new FT-100 and ATAS-100. Just got them installed last night.
Currently I don't have anything connected to the VHF/UHF antenna port. I
want to use the ATAS-100 for both ports but have not purchased a diplexer yet.

Which diplexer is everyone using? Which diplexer seems to work best?

Thanks for the help.

Hi Lee

I think you will want to put in a duo-band antenna for 2 m and 440, that will have one line comming in and it will plug into that vhf/uhf jack.
I have also just installed my ft-100 and and am using it that way, I have the High Sierra Screwdriver but not installed yet as still have to run some more wire for that.

Hi everyone!
Recently has gained itself FT-100.Work much well and I it complacent.I wants to connect its to the computer but can not nowhere buy CT-62 Interface Cables(I live on the Ukraine).I have a cable for two computer joining on COM ports and there is a DIN-8 connector.I wants soldering connectors but not know as correctly this do.
Can who knows what contacts DIN-8 connector on FT-100 correspond what contacts COM port 9pin
connector?
Shall much thanked for the answer.
With best regards !
73 de UT5JCW Serge.

Hi all,
Just to introduce my self first I am a newly passed novice amateur radio operator and am awaiting the results from my recently taken full RAE.
I shall be giong to Florida for a few weeks shortly and was wondering about the prices over there for things like the CTCSS board for the FT-100.
Anybody out there got any info or dealers in the Orlando, or Tampa Bay area?
Many thanks Ray 2E1RAY

Rick,

I've been looking for the same thing. I stumbled across this company that makes HF radio slide mounts. The only ones they carry have only 1 RF connection though. They have an option to add an additional 2 contacts, but not RF. Perhaps this is something we can start with though.

http://www.gamberjohnson.com/slidemount.cfm

AES carries this line. It's not cheap though. The kit costs $80 and an additional base mount costs $45. For me, I'm not sure I want to spend $120 for something that doesn't have everything. I bet I could weld up something for a lot less that may do the job. Hmmm....

Here's the AES web page:

http://www.aesham.com/gam.shtml

Here's the list as I have it:

N1RWY Jay ME
N1QXV John TX
WA2SRY Larry NY
WA2WIM Neil MI
K3FQI Bill PA
K4KAM/AG John FL
KD4IBI Chris VA
W4TGA Barry GA
KG4FET/AG Sandor FL
KD4WOV Tom MO
K6RCX Erwin CA
N6TGK Stephen CA
KA6LSL Bob CA
KF6SWI Mike CA
KN6OL Dan CA
N8RGR Norman OH
WB8AUK Dave OH

G3OUT Andrew U.K. (This QSO would be a real treat for me)

Sunday, 23:00 UTC (4:00PM Pac, 5:00PM Mtn, 6:00PM Ctl, 7:00PM Est).

23:00 UTC 18.140 MHz.
If busy,
23:05 UTC 18.150
If nothing,
23:10 UTC 14.240

I think I finally got the time correct after reading "Time Telling
for Dummies."

Having said this, I hope I can get my truck back together and out of
my garage before tomorrow evening.

Have I missed anything else?

Ray,

Amateur Electronic Supply has a location in Orlando. Look at their web page:

http://www.aesham.com

Their prices are comparable with just about anyone else that I've seen. I've been pretty satisfied with them as well.

This is a line from their catalog. Unless they are running specials, this should be the price:

FTS27 YAESU CTCSS DECODER UNIT $47.95 US

73,
Dan KN6OL

3556. "Select" switch rotary problem.

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-04 06:46:23 UTC
From: Serge Zhovtobrukh
Topic: 3556 Message: 3556

Beside I appeared such problem:
Under quick rotating a switch SELECT numerals leap through one or through
two for instance
start 1step 2step 3step 4step
10.000.00 - 10.010.00 - 10.030.00 - 10.040.00 - 10.070.00 ....

Why so is got? Can is broken switch?

With best regards! 73 de UT5JCW Serge.

Nice to know I am needed !!! Sorry, just realised that at 23.00UTC tonight will be dining out celebrating someone's wedding anniversary !! (0900 would have been fine !!)

Next Sunday, I doubt that the rig will be back from Yaesu. Could use the TS50, sorry, naughty words !

The following Sunday might have it back AND a Cubex 2 ele. quad airborne !!

Can't wait.

I think I won't be able to make the net because I work at 4pm Sunday, but if anyone's around just before 2300Z, I can say hello on my way to work.

I sent my FT100 and ATAS-100 to Yaesu recently to have them do the improved grounding on the low-pass filter. It is has worked well for the past 2 days. In fact, I worked ON4AJW on 17m SSB Friday night on my way to a party in Oakland.

Keep your fingers crossed :-)

Dan,
Sounds good to me. I will not be able to make every net as I usually have some Sunday activities that start around 5pm.

But, on the 11th, I will try to check in mobile from Yellowstone. I will be up there for a week and would like to see how many contacts I can get with other states.

HI Lee,
Congratulation on the radio and the install. For me I found that no diplexer works best. I use the ATAS100 for HF and have a separate antenna for vhf/uhf. The ATAS works at vhf/uhf but not very well. Besides, the cost of the separate vhf/uhf antenna was less the the cost of the diplexer.

John,

Did Yaesu charge you to do that? I'm thinking of sending mine
in to them to:

1. Install 500hz cw filter
2. Install CTCSS Decoder
3. Replace 'thumb lip' thingy that broke off that holds the front
control head in place on the main radio. (To the right of the tunning
knob)
4. Bring up to all current modifications.

Chris K6SUY

I have one of those cables. I took the DE-9 shell apart and found
a very small circuit board which had RS-232 level converters on it.

The FT-100 has TTL-level I/O, the CT-62 converts that to RS-232.

The FT-100 informal net today was a lot of fun. There obviously was a boatload of traffic on the frequency, but the big signals were:

K6WFV - Bob - California (motorcycle mobile!)
WØPJK - Bob - Arizona
VE6TRM - Tom - Alberta
K4KAM - John - Florida

Adjacent channel interference made copy difficult for other stations.

73 to all. Let's do it again.
Ray, W8RD / mobile / Ohio

Note to K6WFV: Bob, the homebrew screwdriver on the bike sounded great. BTW, I heard you mention your FT-847. Please take a moment to visit my FT-847 Web Site, Bulletin Board, and Knowledge Base at:

http://www.en.com/users/rayd/ft-847

From here in EN80 contacted K6WKV, also heard him quite well with his FT100 on the motorcycle.

Heard VW6TRM, K4KAM, VE6TEM, KA4U, and W0PJK (big signal) also lots of QRM!

Found out I have RF getting into my audio (old icom 745), time to rebuild radio console (crude bench with shelves).

FT100/ATAS100 in Lumina, working fine on all bands up to 50mhz. 2M SSB on M2 HO loop.

Cannot get ATAS 100 to manually tune with PTT & up/dwn. Any ideas?

K6WFV (Bob) was loud and clear on his motorcycle mobile and talked with him when he got on his base.

Also talked with N1RWY (Jay) in Maine.

Could hear WB6AUK (Dave) in Ohio, KA6LSL (Bob), and W0PJK (Bob) in Cottonwood, Arizona.

Couldn't hear W4TGA (Barry) in Ga.

Was running 50 watts into a B&W broadband folded dipole, about 30 feet above ground.

California and Maine - not too bad for my first HF contacts in the log!

Unfortunately I did not pay attention to this thread - the guy that
typed in a time in 24 hour format and put a PM after it blew my mind. :-)

But I can tell you that the County Hunter's Net runs almost 24 hours a day
on 14.336!!! And those net control ops are L-O-U-D.

Chris,

There was no charge from Yaesu. And they worked on it pretty quickly.
I am going to put out a long note to this list with the whole story of my
FT100 and ATAS-100 problems, but I am waiting a week or two to see if the
problem (ATAS fails to move) is really solved now.

Well,
From coastal Maine I was able to copy 5 stations during the net, and
then heard W8MM and K6RTA after the net on the frequency talking
about missing the meeting. (You guys were loud BTW!)

Stations heard:

Barry, W4TGA
John, K4KAM/AG
Bob, W0PJK
Bob, KA6LSL
Bob, K6WFV (heard both on the motor cycle as well as at the shack)

I was on the FT-847 and the R5, (2' off the ground on an umbrella
stand) the diamond mount for the ATAS 100 should be here on Tuesday
so next week I can try to check in with the FT100 next weekend.
(It will be a good break from the VHF contest)

If nothing else, it was a good test..

BTW: Several of the folks here on the list have reported a bug where
the keyer sends as' U' instead of a 'W'. Have any of these folks
sent there rigs back (maybe for other reasons) and found that this
keyer issues was fixed as well?

- Thanks guys for 4 new states on 17m to boot!

3580. Fixed AF level output - not! & PSK31

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-05 03:17:49 UTC
From: Tim G4WIM
Topic: 3580 Message: 3580

Hi,

I mostly use my Ft100 on PSK31, utilizing the fixed AF o/p level to feed the Digipan S/ware running on my PC.
However, something odd has happened and I can't seem to fix it.
The 'fixed' AF o/p level is now affected by the volume control!

I've tried changing modes and turning the unit on and off etc - but to no avail.
Any suggestions ?

BTW I'd be interested to hear how others configure their FT100 for PSK31 and what if any filters used.

Thanks

Tim W6/G4WIM - but waiting for my new extra class callsign any day now :)

I'll recap my experience. I bought the radio just after Dayton LAST year. Didn't do much with it until summer. Some time in the fall I noticed the "U" problem. I called Cerritos and they claimed surprise and couldn't duplicate the condition on any radios in the shop at the time.

I sent in the unit this last winter and complained of it and other things. It came back fixed, with no real comment as usual.

I bought another FT100 for a friend this past winter. It has this, but NO other, problems. I don't think he will be too concerned about it, but if he has to send it in for any other problems I'll be sure to remind him to have it fixed.

According to K0LEE, I think, most FT100s do have the "U" problem.

Hi Folks,

At 2305 I got on and after a few minutes heard K4KAM/AG, W4TGA both in
the driveway and in the house, and a weak KA6LSL. All on 18.150. Others
too weak to copy. I called several times, asking for a relay to Bob, but
no one heard my 85W into the beam (I was in the house). Swung beam from
GA up "west" to CA and north to ME for 30 minutes.
I too shall try again.

Ok, it was operator error :) The FT100 was operating perfectly with a fixed AF output to the PC. Problem was with the PC, I'd set the AF input source to be the microphone (not line) doh! So by adjusting the
FT100 speaker volume control the level into the PC varied.
Interestingly PSK31 worked fine with this acoustic link between rig and PC !

I'd still be interested to hear about others experiences with narrow IF filters, and tx audio settings when running PSK.

Tim

In New Jersey, all I heard was dx from Europe, so after 15 minutes of tuning around I gave up and worked a few DX, LZ1QI and YT1VP. I got good 5x9 reports and was able to break pile ups on first call with my new Ft100 and ATAS-100. I LOVE this radio and antenna!!!
I'll try again next Sunday.

3589. FT100 inside pictures

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-05 14:53:43 UTC
From: Robert Gauss
Topic: 3589 Message: 3589

I have posted to the shared files area some pictures of the inside of the FT100.

I was a little disappointed when I saw the inside. I really expected it to be neater wiring. Radio is 9E seril number little more than 1 year old. Has been back to Yaesu once for dead HF PA. Can anyone tell from the pictures if the 'mod' for stability has been done?

Also is one shot of my radio mounted to a clip board with a clamp-on ferrite. This mount allows me to stick the radio on end in the car without smashing leads and to easily move the radio about with some protection of the front panel as well.

This is what you might be thinking of:

I'm in the process of doing a mobile install as well. Had the FT-100 on my bench, checked it in all modes, all bands....no problem. It sat for two months
hooked to my BBS running a 9600 baud link (excellent 9600 baud performance I might add) , and yesterday it went in my truck. The oscillation problem showed up immediately on 12, 10 and 6 meters. Like Scott, I had my speaker mounted away from the radio, behind my head. So I tried the ferrite trick on
the extension cable for the speaker. Unfortunately, that failed to cure the problem.

So back through the archives to find the info on the grounding problem on the filter board. Looking inside the radio, I too had the copper strip from J1015 to the chasis. I used a small piece of copper braid from RG-58, and very carefully tinned it, formed it and soldered it in place. That cured the problem.

It takes about an hour from the time you open the radio to the time you button it back up. For those that have to go this route to solve the problem, work slowly,
methodically and patiently. If your'e unsure, send it back to Yaesu and make them correct the problem.

73's

Albert/WB7AWL

The SWR problems I remember seeing on this list were caused by RF getting back into the radio through the Mic cable, VHF antenna line, and external speaker cable. Also adding length to the coax (for short runs) has helped some people. I'm not sure if the above internal fix overcomes all or some of these or if the problem is separate.

Brett - N7OLQ

I 'think' i can see both of the straps in the top view pictures. They should go from coax back shell to ground (foil on the casting)in the filter board. The problem is the copper tape they use for gnd. doesn't always make a good gnd.

3603. RE: [FT100] New poll for FT100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-06 00:54:32 UTC
From: Dale L Martin
Topic: 3503 Message: 3603

I find it difficult to respond to the poll adequately.

My FT100 has never broken (I broke it). It works FB.

Great. Congratulations.

Question out of curiosity:

Did you try the ferrite 'unit' prior to sending it in to Yaesu for service?

3605. FT-100 not transmitting on any band

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-06 01:36:52 UTC
From: timkg8xq@mich.com
Topic: 3605 Message: 3605

I have been using my FT-100 since Dayton last year. Until now there are no problems. Last week I worked VK2APG on my way to work but this last weekend I noticed High VSWR warnings on the radio with no changes to the radio or antenna. When I put the analyzer on the coax connection it read 1.7:1 for 20m, so then I checked all connections. Nothing amiss! As I checked the various bands with the outbacker and various monoband whips, I noticed less and less power output but the same VSWR readings. Now, absolutely no output when keying the mic. Not HF or any band. I reset the processor, losing over 85 memories, but still nothing. Can anyone tell me if I'm going insane? Am I just missing some small dumb little step or should I break down and send the rig in for repair?

Anyone have any suggestions?

Thanks in advance.

Tim, WD8X

-Gee thats too bad. I am dreading the day mine quits. I sent my FT-8500 in to Yaesu in January, got it back in April and sent it back in for same problem in May. I called them to find out what was going on and they said I must have switched main boards as the part they replaced on the original 4 month return fix had not been changed. I guess they figured I had a pile of broken FT-8500 radios all with the same problem and I was cycling them back to Yaesu for the same repair at no charge. I guess that means the FT-8500 usually has the same problem when it comes back. Strange huh?

For the record, real close to 2300Z, I heard K6WFV/mM :) as he threw out a few calls on his FT-100, and I think he almost got my call right, at least the K1 part. QSB made for about 50% copy. DIck, W1KSZ, also came on early (also from FN42 in MA). K4KAM/AG was Q5. Then I got underway and couldn't make out much thru my auto hash and QRM, though I did get Bob's 847 at home coming thru better.

I just got an FT-100 last Friday. Keyer sends "w". Serial number
9EO3xxxx. I'm amazed at the technology crammed into this small box.
It does have some oddities such as the pigtail out the back and fans
on almost all the time, but I understand why they did it. My
"select"
knob has some play between clicks... anyone elses?

I noticed that my FT-100 master clock is off by about 20-30 hz from
WWV (getting on 15Mhz WWV and switching back and forth between USB
and
LSB you can hear a difference in frequency pitch). To get the pitch
to
match I have to move the readout to 15.000.03. Anyone know where the
pot is to adjust this discrepancy?

The encoder on mine has always had allot of slop in it too. Its my only nit-noid gripe about the radio. A friend of mine just recently bought an FT-100 and his is perfect.

My rig originally sent W, after the 1st PA replacement it sent U, after the second PA replacement it still sent U, but after the third PA replacement it now sends W again.

There is a files section (http://www.egroups.com/files/FT100/) in the eGroups web site that allows you to upload pictures. A word of warning is in order. A reasonable size for a .jpg to display in a browser is around 40-60Kbytes or less. If you're uploading 1Mbyte images that are the size of a football field, no one will take the time to look at them. If you scanned the pictures, use the software that came with the scanner to size the .jpg before uploading it. Then test it to see how it looks in a browser. If you don't like the results, delete the file and try again.

I have posted 2 picture in the file section of my Ft-100 / Jeep Wrangler installation.
The center console is an after market all steel security console. The HF antenna is an Icom AH2-B with a SGC SG-230 tuner. I went with the heavy duty Icom whip and mount as I did not feel the ATAS would put up with off roading.
For 2M & 440 I have a Diamond dual band mounted on the passenger side in the rear.
So far the installation is working good and the security is not a concern.

Dave and Others -

Manually tuning the ATAS-100 seems to only work if you use the UP and DOWN buttons on the rig and not the ones on the Mic! THe manual doesn't mention this but I think it is an omisson on their part. If I'm wrong then please correct me. I couldn't get the UP and DOWN buttons on the Mic to work either!

From: Rob Boux
Topic: 3629 Message: 3629

Hello all,

Can anybody give me some idea on how well the on-glass 2/70 antenna by either larsen, MFJ or Radio Shack works. I'm thinking of going that route for 2 meters/70 cm. on my '99 - chevy Blazer. I have only a few places that I can mount an antenna and the glass mount method sounds pretty good if they perform well. Which make is the best. The MFJ sounds like a good choice but Larsen is a very good make also, but double the price of the MFJ or Radio Shack. Any information on these antenna's would help me out, as they all "look" good to me!

You are correct, it would make sense if you could use the buttons on the mic since
you already have the PTT down. You are supposed to be able to program these buttons on the mic to function for the up and down but I have not gone through it.

I prefer Larsen over the others mentioned. Keep in mind that these antennas
can not be installed on a window with factory tint that has a metallic base
to it so if there's tint in the window find out what it's made of.

There are two types that I've seen out there. One is 1/2 wave, while the other is 5/8. I think the Radio Shack and MFG are only 1/2 wave, but not sure. If this difference is important to you, you may want to look at that part of the spec.

Both will offer significant improvement over the ATAS on VHF/UHF though. If you live in fringy areas like me, you will want the best 2m/440 performance you can get. Others I have talked to have no problems with a 1/4 wave, so just about any antenna will work fine for them.

Actually, I didn't find out about it until quite awhile after the 1st trip to Yaesu when someone else on the list brought it up. Since it worked originally, all I can assume is that it fell under the 'updated to current specs' line on the work order.

I tried a Larsen on the back window of my pickup and due to the tint in the glass the antenna would not work. Also it states in the instructions they won't work if you have any wires (heating elements) in the glass. If you have clear glass you may have some success.

Check with your GM dealer as to type of glass in your Blazer.

Been thinking of making a mod to the radio that would allow you to move the antenna without having to key up. Perhaps you could get close enough on background noise only. Perhaps two-way toggle switch that would use the FT-100 internal voltage sources to send the voltages to the ATAS-100.

Anyone else thought this would be usefull? Maybe it would be a waste.

I don't think it would be a waste. I don't know how much power the radio puts out when tuning the antenna but I would think it would be preferable to get the antenna as close to resonant as possible before doing the rest of the tune up procedure. Besides, it would be useful for using on shortwave broadcasts not in or near an amateur band. It would allow you to tune the antenna for best reception without actually throwing out a carrier in an unauthorized segment of spectrum to tune the antenna and I would think it would save some wear and tear on the PAs.

Hi Dan,
If you look at the controller made for the IC-706 radios by Am-Com Inc. in Lakeside, MT. you will see that he has done it with an external box which coax feeds through. Has a switch for antenna movement that provides the proper voltage for going each way. He was selling them rather quickly at Dayton. I was told the voltage to extend is highest and to retract is lower. Does anyone know of the exact voltage to retract the Atlas 100?

Your idea on the toggle switch is the same as on my Don Johnson SCREWDRIVER. That antenna uses the same voltage going both in and out but the Atlas 100 doesn't.

As for power out while tuning, how many watts are being sent to the antenna during the tune mode?

Bob KA6LSL

P.S. Your suggestion of a Sunday net was good except the traffic right above the frequency was tough. Only completed contact was with Jay, N1RWY in Maine. I heard Barry, W4TGA say he could hear me once and that was about it. If many knew the frequency and the net had to move down or up 1 or 2 kHz folks should be able to find the FT-100 net.

3645. RE: [FT100] Re: ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-08 05:21:20 UTC
From: Mike Krueger
Topic: 3378 Message: 3645

The FT-100 sends 10W to the antenna when tuning - plenty safe for the PA and other components, even under the worst possible SWR conditions.

With reference to the "toggle switch project" mentioned earlier today: A key component of the FT-100/ATAS-100 auto-tuning involves the transceiver "remembering" where the antenna is. Extending or retracting the antenna by means other that those provided in the FT100 (or FT-847) will cause the radio to lose this reference and require calibration the next time it is auto-tuned.

Cheers,
Mike

I had to send my FT100 in for repair twice due to the "high swr icon" problem. Turns out it is the ATAS100, not the radio. The inside of the ATAS100 has become corroded-it appears water can run into the tuning network at the point where the whip enters the main body of the antenna! My shop said that for all ATAS100's they sell they now recommend using some coax seal at that point.

I don;t remember exactly what the voltages were but I had the ats100 on the bench and provided it with a current limited bench supply. + to the center pin. It goes out at around 11 to 12 volts and back at around 8 to 9 volts. There is a no movement area in between. As I recall the current was only 100 to 200 mills. If anyone want exactitudes I will measure again.

Hi,
I'm thinking about controlling my FT100 via the CAT interface. Does anyone have any experience or recommendations about what program / software to use ? Shareware or purchased - which ever is best !

Thanks

Tim AD6OP (G4WIM)

3654. Astron use with FT100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-09 11:23:13 UTC
From: gerald.kopstein@us.ul.com
Topic: 3654 Message: 3654

My FT100 went up in smoke and fire as I said before. Yaesu reports the PA unit lost a number of components and traces on the board burned! They are trying to say it was the power supply, either a spike or surge! Interesting.

Anyway, I'm using an Astron SS30M based on AES' recommendation. Anyone else out there using the Astron, and if so, did you have to adjust the voltage output by going into the unit? I measured the open
circuit voltage as 14.13 volts. Could 0.3 volts over 13.8 cause such a drastic burnup of a rig? Should I be looking to replace the power supply?

Jerry N9AC

Your power supply has an internal adjustment for output voltage and can be adjusted back down to 13.8 volts. 14.3 volts shouldn't be the root of your problem, however. Yaesu states that the power requirements are 13.8 +- 10% or 12.4 to 15.2.volts so you're still within specs. I had an RS-20A blow on me while connected to an FT-890 transmitting on 10M. No damage to the FT-890, I was able to fix the RS-20A and learned something about how the Astron manages output voltages. Your Astron should have protection on both the input and output. It has Surge protection on the input and if the voltage on the output reaches harmful levels it triggers an SCR that will shut down the supply. If the problem is in the Astron, it could be one of these circuits.

While I like the FT-100 and have had only one problem with it when the
6 KHz AM filter took a dump, it sounds like Yaesu is trying to place blame
on someone else instead of just fixing the radio and making the customer
happy.

We use Astron power supplies on our nodestacks, and I use three of
them here in the house. I can pretty much state from experience that
major problems our packet group has had, and also within my own
shack, are blown pass transistors and one 723 regulator IC. Out of
roughly 11 power supplies, that's two or three pass transistors over the
last 5 years, plus the one IC.

I've seen the crowbar circuitry trip many times on our nodesites. Power
to these sites is not usually stable, and adding in the occasional garden
variety thunderstorm, it's pretty clear the crowbar circuitry is doing it's
job and saving our radios from damage. When I go to a site, and see
there's no power, the first thing I do is measure the voltage coming out
of the power supply. In every case, when the voltage is zero at the
terminals, the crowbar circuitry has tripped. I have never seen one in
an overvoltage condition, without the crowbar circuitry having been tripped.

Can a spike get through, and damage your radio....??? Sure, it's possible,
but my experience so far has been no. Tell Yaesu to fix the radio, and "move
on".... :-)

Incidently, does anyone know right off the top of their heads what the maximum
voltage those transistors will withstand...???? If the peak voltage is 28
volts,
or anything higher than 12 volts....it would seem to me that would make the
arguement that it was'nt the power supply that much stronger.

Has anyone found the ATAS-100 with a high SWR on 6 meters? I was checking it with my
swr analyzer (mfj-269) and found that it about 4:1 and the FT-100 shuts down on this antenna.
I also found in checking other freq's such as 40 m 2:1, 20 m 1.1:1. I am also woundering has
anyone tried changing the length of the whip part. I don't want to make any changes in the whip until I know that it would help?

As I was in the process of fixing the RS-20A I accidently substituted a TIP30(PNP) for the TIP29(NPN) instead of using a TIP31(NPN). This confused the hell out of me as it doubled the output of the supply and after a few minutes dramatically blew Capacitor C101 across the output terminals. I had about 28 volts output for about 15 minutes until I discovered my mistake. After realizing my goof, I tested everything and all remaining transistors were still good. After installation of the TIP31 everything is performing to spec and it maintains 13.8v with 100watts out from the FT-100.

From: Dan KN6OL
Topic: 1680 Message: 3660

In my rooftop installation, I have better than 1.2:1 SWR on ALL bands (440 - 40m) with the exception of 6m. My swr is a little higher for some reason on 6m, but still well within range of the FT-100. This may be a characteristic of the ATAS.

I would only recommend that you consider/reconsider excellent grounding/counterpoise of the installation, and try the additional lengths of coax kludges previously posted.

Counterpoise and antenna location seem to play a CRITICAL role in SWR. I have found that moving the antenna from the roof to the bumber results in not being able to get good matches on several of the bands (including 6m). I do have fair to good grounding on the bumper mount. I plan to work this weekend on getting excellent ground on my bumper mount to see if that increases the performance (and reducing the SWR) of the ATAS. I have a truck, so mounting to the bumper puts most of the antenna above any metal.

Once again, it seems that placement of the antenna relative to other metal can affect SWR drastically (as has been my experience). I have seen many sucessful installations, though, at lower than roof mount locations, so it is possible to make those type of installations work.

I have my ATAS-100 mounted on a GeoTool stake pocket mount on my Ford Ranger. I added grounding braid from the mount to the bed of the truck and then ran a length of grounding braid in each corner of the bed to the frame of the truck. The ATAS-100 tunes up on all bands HF wise but is flaky on 6 Meters as well. I don't use it on 2M/70cm so I don't know what the SWR is there. Anyway, my ATAS-100 won't tune up on 6M automatically but I can manually tune it and then once I release the microphone after manually tuning it I get a high SWR warning. I was told by Yaesu Tech Support to try adding snap on chokes on the coax as close to the radio as possible. I need to get some... I had a few and it has helped some so I'm hoping if I get more it'll do the trick.

As for the replacing the whip... I'd heard of someone else asking about it but I don't know if they actually did or not.

On a hunch, I looked at the CAT commands in the manual for my FT-890. With the exception of the formatting of the Parameters, All but one of the Opcodes for the FT-100 are the same as the 890!! A lot of the codes used in the 890 aren't listed in the 100 manual and the only one that is different is 8C for filter selection and that particular code isn't used by the 890. I wonder about the possibility of an undocumented feature here. Is it possible that Yaesu released the FT-100 before they worked out all of the bugs on memory access using the CAT interface? Is it possible that very little modification to a program that runs the FT-890 would work with the FT-100?

Does anyone know where I can get a copy of an FT-890 CAT program that access memory?

(here we go again...the conspiracy continues)....

How about this?

Yaesu was telling the customer that something external caused the problem
and that it was something external like a spike or surge or power supply
problem might be the cause.

It seems to me that that is not so much a shift of blame but more a
suggestion to the user to check external equipment to make sure it did not
cause the problem. Maybe, just maybe, Yaesu could find nothing inside the
FT-100 that would cause that kind of fault/failure/damage.

Geez....

I finally stumbled across the connector used for the BAND DATA Cable Pigtail.

While rumaging through my junk box I moved aside my bag of old macintosh cables and found an old SUN Optical Mouse that had the connector that fits the FT-100 pigtail. Unfortunately it only had 3 wires running through it and they weren't attached to the pins that I wanted to use. Then it hit me that the connector looked very similar to the old Macintosh Serial cable. Ta-Da!!! I have several Mac Serial cables that end in a DB-25 male connector. Quick-Snip and install an inexpensive DB-9 Male and I have the CAT cable. These cables are plentiful at computer shows and Hamfests and for a lot less than the $30 that Yaesu wants.

There is a TTL to RS232 level converter inside the DB-9 connector (or so I'm told). Please let us know if this cable works OK, because that would certainly open up an inexpensive source for cables!

I finally stumbled across the connector used for the BAND DATA Cable Pigtail.

While rumaging through my junk box I moved aside my bag of old macintosh cables and found an old SUN Optical Mouse that had the connector that fits the FT-100 pigtail. Unfortunately it only had 3 wires running through it and they weren't attached to the pins that I wanted to use. Then it hit me
that the connector looked very similar to the old Macintosh Serial cable. Ta-Da!!! I have several Mac Serial cables that end in a DB-25 male connector. Quick-Snip and install an inexpensive DB-9 Male and I have the CAT cable. These cables are plentiful at computer shows and Hamfests and for a lot less than the $30 that Yaesu wants.

These connectors are readily available in the uk from Maplin Electronics
www.maplin.co.uk), I believe they call them mini din plugs and are
available in several pin configs..

After discovering the connector on cables that I already had, I found the connectors in American Electronics in Clearwater, FL and, yes, they are called a Mini-DIN 8. I now know the connectors are available, but buying a cable with the connector attached means one less connector to solder and not having to buy any cable.

> missed ??
>

This is in the FAQ, but the link to scroll down to it was broken. It should
now be fixed. Here is what we have:

"Storing memories remotely
There are no programs currently available to store your memory settings
remotely, an obvious oversight for a radio with more than 300 memories
available. There was a rumor that RT systems was working on a version of
ADMS software to provide this capability but they have confirmed that this is
not true. They have no plans to support the FT100 with ADMS."

The FT847 is also missing this feature. Someone came up with a workaround
for that by using the 'clone' feature where the PC pretends it's another
FT847 and captures the settings and then allows you to reverse the procedure
to go back again.

See: http://207.206.11.2/ft-847/page1.htm#cloning

It's not easy to do and there is no way to edit the memories on the computer.
The cloning feature is what RTsystems uses on the HTs in order to implement
uploading to the radios. The FT100 doesn't have a cloning feature so it may
not even be possible to upload the memories even if someone were interested
in writing a program to do it.

If anyone knows of a workaround for this, please let us know.

From: Tom Tishken KD4WOV
Topic: 3671 Message: 3672

Hello,
I thought i saw some post something a while back about changing the duty cycle of the fan. I was wondering if anyone has found out how to do this. My ft-100 runs very hot on 2 meters and 70cm. The fan runs on high when transmitting and for about 30 seconds after transmitting, although the rear of the transmitter seems very hot(uncomfortable to touch, but not burning hot)

3674. Ready to buy one...

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-11 02:56:55 UTC
From: David A. Jaffe
Topic: 3674 Message: 3674

OK, I'm finally getting ready to take the plunge and buy an FT100. The main reason I'm choosing it over the 706 is the supposedly better noise blanker, so I hope that's really true! (Has anyone A/B'ed them?)

I have a few questions...

1. I'm wondering whether to get the FT100D. I don't need the speaker, as I'm mounting it in the trunk. The CW filter would be nice. But what about the TXCO?? I've never needed one in my Icom base station (746). I live in a mild climate (San Francisco Bay Area.) But perhaps I need it because the trunk could get hot?

2. What about the 6 khz AM filter? If I don't get it, what bandwidth is used for AM? Why do people get the AM filter.. for AM operation or for short wave listening or both?

Thanks,

David

I would get the "D" version strictly because you know it has the latest mods. If you order the old version, maybe it is up to date, and maybe not.

A dumb question, but would you need a 6Khz filter to talk on CB? Does the FT100 broadcast in AM on the CB band? I know CB radios are dirt cheap but who wants to mount another radio. Having the ability to talk on CB may be useful in an emergency. There are probably more truckers with CB than HAMs with HF.

I have personally had two Ft-100's and two IC-706G's in the last year. Both the Yeasu's were returned to the store with-in a week for major failures and I went the Icom route instead. The Icom's have never acted-up at all in the last year and I personally think its a great radio. You were asking about the noise blanker on both radios, well both radio's have good blankers and the Icom is just as good as the yeasu's in my option. But if you want a report on which radio has better intermod rejection on 2/70, then you better go Icom because the Yeasu had quite a-bit more than the Icom. I still think the Icom 706G is a better radio, but if you want to go for a "micro" radio than Yeasu has the 706G beat. Good Luck!

I have had one FT-100 and, except for one self-induced problem (I blew the 500 Hz filter soldering job), it has worked and continues perfectly. A friend and I caravaned back to Houston from the Dallas Ham-Com convention last night. We both have FT-100's. His has worked perfectly, as has his ATAS-100.

I'd say, go for it. If you like the specs, looks, etc., of the FT-100 over the IC-706, then get one. I don't think you can make a bad decision if you go either way. They are both good radios.

David,
Good pick going with the FT-100, I really like mine, and has performed well except for the fan noise.
What ever you do, do not buy your FT-100 from Texas Towers, they want nothing to do with you or the rig after the sale! Should your FT-100 have problems?

Also,look at the top surface of the radio. On the FT-100,the case is
modified to accept the larger speaker. It is raised above the rest of the
top surface about 1/8 inch.

Beware! If you use your amateur HF radio on the CB band you are opening yourself up to a Violation Notice from the FCC, with a possible fine and revocation of your license. Only equipment specifically "Type Accepted" by the FCC may legally be used on CB. There have been numerous instances lately of the FCC cracking down on Hams who use their equipment on CB. Don't jeopardize your license. Be safe, spend the $25 or so and get a CB transceiver if you want to talk on that band.

As most of you know I have been selling the OEM power connector on the battery side for the FT-100

I may be able to stock a few additional items and was wondering if anyone on the list could give be input.

The two new items would be:

1. The female connector (radio side) for the FT-100

2. New replacement top covers with the new speaker of the FT-100D.

Does anyone think that these items are a good idea?

Would anyone linke a new top cover with the bigger speaker?

I would like to see the specifics regarding these cases. The FCC doesn't do much enforcement in the post Ronald Reagan era. Reagan changed the FCC into the spectrum selling machine it is today. You can hardly get the FCC to go after a police jammer, let alone some guy using non-type-approved equipment.

In California, we have certain individuals who are using CB freqs with killer linears to talk to family members in a nearby country, rather than pay long distance phone charges. [Is that PC enough?] The FCC does nothing about this, even when the situation is written up in the San Jose Mercury News. I don't think they will care about an FT100 used on the CB band.

You hear the same stories about using ham radios on FRS and GMRS. Again, illegal but no enforcement. I bought my first ham radio HT used from a company that was using Kenwood TH78's for their commercial operation.

You need to assume the FCC has priorities, and nit-pickings isn't one of them.

hi in my astro setup i am using a diamond so238 style mount with the
6 ft of tiny coax i have installed the mount right thru a ladder rack
then drilled a small hole in the top to pass the coax thru. i then added
10 ft of rg8x to complete the run to the rig location, i have the rig
grounded where it is mounted and have not had to use any bonding
straps.the motor noise on all bands is nil with this set up. too bad the
band condx are so lousey today.

3690. using ham rig for cb

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-11 19:23:39 UTC
From: kenneth m cubilo
Topic: 3690 Message: 3690

if you want to use a ham rig for cb use, why even be a amateur in the first place. geez. go pay 50 bucks for a cb rig. oh yes the other fellow is right go ahead and get busted by the feds once for a modified radio and pay the price.

Well, we have had good luck and bad luck for UK shipping. It all depends on the weight as you know. I have sort of discouraged UK shipping, but we have done it. I believe the web site lists an awful high price for shipping.

BUT, what I have done as people question the shipping I tell them to order what they want and pay the web site shipping. If it is way over I send them an email telling them that they have a refund check coming for the difference. This usually makes everyone happy. At this point I have no other solution. So far we have had 4 shipments into the UK.

Currently, we are currently developing a new store (bought new software for the server) and it has quite a few more options for shipping and is a lot more configurable. So, eventually we should have all international orders handled for shipping.

All this takes time and I am working a little bit every night to get the store operational (it's buried on the present server in a hidden folder). Hopefully in 2 - 3 months it should be up and running with a new shopping cart, pictures, better descriptions, etc.

Sorry, for all the replies, I though they were going privately to each person. Can't figure out how to do that now.

Shouldn't the replies go to the person by default, not the list.

List moderator???

From: Dan KN6OL
Topic: 3671 Message: 3695

Here is a post of the 2nd set of menu functions. Menu function F48 and F49 have something to do with overheat. I don't know if these have anything to do with the fan, but they may.

-Dan

Their is a second set of menu functions F01 to F59.
WARNING: changing these will reset all the memories.
I want to warn you do not change these values unless you are
sure of what you are doing.

To get them turn transceiver off. Press and hold the A,B,C keys;
while holding them in, press and hold in the [PWR] switch for
1/2 second to turn the tranceiver On. Now let go of all keys.
Then press and hold func key for 1/2 second to get to the
menu and then rotate the select knob to get to a second menu
(F01 to F59) it's after #66 or before #01.
When you turn the rig off and back on it returns to normal menu.

Here is a list of the 59 second menu functions.

Function Setting in my radio
F01 144 RF GAIN 166

From: Dan KN6OL
Topic: 3674 Message: 3696

Can't speak for the 706, but the FT-100 has the best imod rejection of any radio I've ever had. I have an HT (most HTs are pretty poor on rejection, so that isn't a fair comparrison) and an Icom IC-2000 2m rig. I run the Icom through a Radio Shack 2m amp with a helical resonator passband filter (which greatly assists in intermod rejection in my installation). I will say that even with this configuration, the FT-100 has extremely superior intermod rejection performance comparred to this install. I commute along side a mountain with high-power pager antennas, and I get the worst of it. Now, with the FT-100 and a comet 7/8 wave 2m antenna, I get NO sign of intermod interferrence.

I will add that changing any of the IF stage settings in the FT-100 can reduce the rejection characteristics.

> I have personally had two Ft-100's and two IC-706G's in the last year. Both the Yeasu's were returned to the store with-in a week for major failures and I went the Icom route instead. The Icom's have never acted-up at all in the last year and I personally think its a great radio. You were asking about the noise blanker on both radios, well both radio's have good blankers and the Icom is just as good as the yeasu's in my option. But if you want a report on which radio has better intermod rejection on 2/70, then you better go Icom because the Yeasu had quite a-bit more than the Icom. I still think the Icom 706G is a better radio, but if you want to go for a "micro" radio than Yeasu has the 706G beat. Good Luck!

Topic: 3697 Message: 3697

I have heard of many having trouble with 40m. My installation is a hole drilled in the roof, and I have no problems on any of the ham bands. I have heard of 40m problems with trunk lip mounts and other type of installations where the base of the antenna is lower than the roof line. I have also heard of sucessful installations in the same configuration. I might be able to deduce that the differences have to do with good grounding and counterpoise.

There are many previous posts on this board that share the experiences of these installations. If you haven't already, I would highly recommend that you take time to read them. There are many and they are all full of good information. Also see the posts under the Files options. There are photos of installations.

3698. RE: [FT100] using ham rig for cb

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-11 21:30:53 UTC
From: gary
Topic: 3690 Message: 3698

Two reasons:

1) One less rig to mount, i.e. less holes in the SUV. Money is not the issue.

2) In emergencies, there are more CB's than HAMs, mostly truckers. I want some back up plan if I go off road and get stranded, other than hike 30 miles.

Again, give me the names of the hams that fined by the FCC? The same claim is made about using ham gear on FRS. Not everyone I know has a ham license, and often hams are reduced to the lowest common denominator, i.e. FRS. Do you really want to carry a second HT just for FRS?

The FCC solves problems. It is not a Nazi organization that makes sure you ID every 10 minutes, your power is under the legal limit, etc.

The FCC has a Livermore Ca. office and can go to the Livermore Flea Market every Sunday and bust HAMs using their equipment on FRS. It hasn't happened yet.

Subject: [FT100] using ham rig for cb

if you want to use a ham rig for cb use, why even be a amateur in the first place. geez. go pay 50 bucks for a cb rig. oh yes the other fellow is right go ahead and get busted by the feds once for a modified radio and pay the price.

I would never advocate using any ham equipment on the CB bands. I agree wholey with John.

However, to answer your question, CB channel frequencies are spaced 10kHz apart (20kHz in some cases) which allows a +/- 5kHz deviation from center frequency without interferring with adjacent channels. Since the average voice audio spectrum is less than 4kHz, a CB will not typically deviate more than +/-2kHz from center frequency (plenty of room as long as the modulation is below 100%). The 4kHz voice audio will fit fine within the 6kHz filter.

The FT-100 can transmit AM on the CB band. You will of course need to select the AM mode. Also, turning down the HF TX power to 0 would be a good idea. Not sure, but I think the FT-100 still puts out over 4 watts (the FCC legal power on a CB) even with the setting at 0. You would be in voilation of another FCC rule (besides the radio not being certified).

If I were stranded out in the desert, I would find that CB channel 9 running 50 watts would be my LAST choice when I have all of the HF and VHF amateur bands to use. You can ALWAYS find a VHF repeater in every instance where you would be lucky to raise someone on the CB that could be of help. I have stopped and assisted many broken down cars who had been trying for some time trying to get assistance on their CB. Even my HT has been able to hit some repeater and I could always find some HAM willing to assist in the circumstance.

Like John, if you ever find yourself setting the VFO to 27.???, don't. In fact, there isn't any real reason to open up the radio's transmit at all. That just leaves you to potiential FCC run-ins.

i really dont want to get sucked into a dead end discussion on this but
1 . amateur radio has always been self regulating and follows fcc rules if
we get away from this
then we are just destined to become a cb service.
2. do you have a amateur license i dont see your callsign listed anywhere
and if so what class?

I too have purchased one of your connectors. The other gender would be nice. It would be nice to see the price a little lower though :)

I disagree Dan. In an emergency, just about the LAST resort would be for me to look for a repeater with someone monitoring in an emergency situation. As one of the country's first EMS paramedics I have stopped at numerous accidents and emergency situations. Your opinion is unfounded in my experience with 27 years of hamming. I have made numerous unanswered calls on vhf repeaters in these situations. The FCC regs allow for any port in a storm i.e. any radio, any operator, any frequency is allowed in an emergency, type accepted or not. The recent shooting aboard the sailboat in the Carribean is a prime example. Do you think anyone, especially the FCC, really cared if the people calling for help were even licensed? no less what radio they used in their dire situation. "potential FCC run-ins"? please get real.

David,
Wether you buy the old or new model FT-100, get the AM filter installed.
Listening to the international AM shortwave broadcasters without the filter
is really terrible. With the filter installed, it's a joy.

The noise blanker really is that good. You won't be sorry.

Nevada has some pretty remote areas. There is nothing like a sign saying 175 miles to the next gas station to encourage you to do a little trip planning. [A good tip is if you see a gas station, buy gas.] I know out on the ET highway there are no ham VHF/UHF repeaters. In fact, a search on www.qrz.com indicates there are no hams in the entire town of Rachel, NV. There is one ham in Alamo, NV, but the mountain range will block your signal.

My point? VHF/UHF is pretty hopeless in many parts of the country.

Remote areas? Hell, the pay phone on highway 6 in Warm Springs Nevada doesn't take change because the phone is so remote that it is not worth picking up the cash.

Keep at it! 15 minutes a day EVERY day will do it in a couple months!

If I can pass it, *anyone* can.

I use the FT-100 to listen on CB, and get all the road information (and a lot of other junk) I need. I carry a CB walkie-talkie for the rare times I need to talk.

Also, monitor 146.52 when travelling. There are a lot of amateur mobiles there.

One good reason for HF mobile is to have the ability for communications when on the road. I would much rather rely on HF Amateur Radio than CB. There are no roads in the world where HF Amateur Radio would not be able to do the job, one can always find a open and active Amateur Band. Listening to the CB perhaps is good to help those who are unfortunate and do not have a valid Ham ticket.

I did not hear any other FT-100 users on the "net" this evening, although there were lots of other stations working DX.

What about sliding up about 3 KHz (18.143, 18.153) or a couple KHz to 14.242? Those frequencies seemed pretty clear.

Ken -

How much better is the larger speaker. If the sound is much better and it doesn't cost a bunch, I might be interested. How much for the other items - Battery side of the power cable, etc..?

Thanks for all the feedback on buying an FT100.

As for the thread that I inadvertently started...

My personal opinion is that it's annoying that the FCC won't type accept ham radios to be used on other bands that a ham could qualify to use. For example, I'd love to use my HT on the FRS (on low power setting, of course), but to do that, I have to illegally modify the radio. Seems like an unnecessary restriction. After all, the FCC trusts us to not run more than 200 watts on 30 meters, to keep our power down on the novice bands, to not use SSB on the CW sub-bands, etc., even though our rigs are fully capable of doing all those things; I don't see why they can't trust us not to run 1KW ATV on the FRS band!

P.S. Still wondering: Has anyone felt a need to get the TXCO; if so, why?

3712. ATAS-100 Trouble and base matching coil disassembly

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-12 00:31:16 UTC
From: Dan KN6OL
Topic: 3712 Message: 3712

Just repaired my 2 week old ATAS-100.

The symptoms were intermittant operation. Intermittant high SWR (key up and wiggle the antenna), intermittant receive signal, intermittant motor operation (press TUN, and while the motor is moving, twisting the antenna tighter onto the mount caused it to fail, while twisting in the loosening direction caused it to work). I believe that tightening the antenna onto the mount may have caused this.

Isolating that the base matching coil is intermittant (including trying my other mount), I proceeded to painfully remove and disassemble this base coil (after all, how hard could resoldering a cold joint be?). I would highly recommend that this not be attempted. It would be nice if Yaseu would have made access to this possible without distruction of the antenna base.

The coil is wrapped tightly around a solid white plastic rod about 1/2 inch in diameter. The coil wire is soldered to the metal mounts at both ends (upper and lower). The only thing securing the upper and lower metal mounts is the external black coil cover (this is the piece that has the Yaseu sticker on it).

The cover is held in place by two small pins (ironically, this appears to be all that offeres most of the stress relief between the upper and lower metal coil mounts), one at the top and the other at the bottom.

Tightening the antenna by grabbing the upper tube (still below the bellows) causes strain on the pin holes of this base coil cover, and ultimately stressing the connections internal to the coil.

Disassembling the base coil showed that the wire wrapped around the teflon tube was indeed stretched and stressed to the point of breakage.

Having said all this, I would recommend that tightening and loosening the antenna from its mount be done only by grabbing the small metal (1/2 inch high) portion of the antenna at the extreme base only. Either that or excercise extreme care not to overtighten it (how much is too much?). I think what I will do next time is use some pliers to grab the bottom of the antenna, and only tighten it from there.

K5UNM has a scan of the matching coil posted in the FILES section of this group, and make an excellent reference for the removal process described below:
http://www.egroups.com/files/FT100/ATAS100.doc

The method that I used to removing the black cover of the matching coil was:

1) The base coil is attached to the remainder of the antenna via 3 large screws located under the rubber cover about 3 - 4 inches above the base of the antenna. Remove these screws to allow access to the motor control board and to the motor itself.

2) The motor can be unplugged from the control board.

3) There are 2 screws holding the motor control board to the base coil mount. Removing these screws will allow the control board to UNPLUG from the base matching coil section. Do not unsolder anything as it is unnecessary (found that out the hard way). That center pin soldered to the motor control board is simply plugged into the center of the base matching coil.

4) There are 2 small pins visible from the outside, one at the top, one at the base. The top pin holds the white teflon tube in place from twisting more than it needs to while the base metal mount is unscrewed from the coil. Remove the small pin at the base (don't know how to do this, other than drilling it out). Drill as deep as the pin depth (about 1/2 to 3/4 inch). I had to keep trying a deeper depth until the base unit (in the next step) was able to turn. I believe that this pin keeps the base mount form turning.

5) Unscrew the bottom metal mount from the remaining coil assembly.

Note: You will notice looking into the bottom of the antenna mount, that there appears to be a second set of threads deeper into the base mount. This is where the outer base mount unscrews from the matching coil assembly. Unscrewing the mount metal piece could have been easy if it weren't for some form of lock-tite used to secure the mount.

6) Remove the upper pin (again by drilling it out ??).

7) Slide off the outer protective shell.

Reinstallation of the cover requires putting on the shell, screwing on the base mount metal piece, then installing new pins (at least that's what seems like a probable factory process). I would recommend that new holes be drilled and threads tapped into the upper and lower mounts, and screws be used instead of pins so that future cover removal be made easier.

I noticed that this white plastic coil core melts easily (thus increasing my doubt that it's really teflon), so be careful when approaching it with a soldering iron.

Has anyone else figured a simpler way to gain access to the base matching coil?

-Dan

Haven't found the need to get the precision TXCO. Since my previous radio was a Kenwood TS-820S, and tapping it on the top caused a 2 kHz drift, I consider the default, low-precision, oscillator to be extremely superior to anything I could have ever needed. I can't imagine who would need this precision enough to pay extra for it, but I'm sure there has to be someone who does.

If you are one of those, get the radio without it, then if you must have it, you can order it later and it's easy to install yourself.

Incidentally, someone asked on a previous post how to adjust the center frequency on this oscillator. There is a procedure for doing this in the user's manual, which involves adjusting the trimmer cap on the oscillator board.

LOOK in this JULY 2000 Pop Comm Page 32 and 33!! Five hams busted operating HF rigs on CB!!!

here is a question from a person who has operated a CB (cobra 142 gtl currently) for almost 18 years. Who will answer you if your in the middle of the desert? I have handeled many many emergency calls on channel 9, But be relistic unless you are out there at night nobody will hear you more than 3 to 5 miles through all the trash!

Second, Why would you put the golden screwdriver to a good hf rig for an illegal purpose? I do carry a cb(in the trunk..just incase i feel like i need talk to truckers on the road), but believe me being in the repair busness for 12 years, aint nothing good ever came out of a hf rig that transmitts everywhere.

Case and example: i have a friend who has the same HT that i do. Mine is not tx moded for out of band tx, his is. He likes listening to Fire, police and federal agencies. one day i kept hearing a moble signal on a local DEA channel. as i listened i finally made out a voice as he talked on his moble rig and id'ed. I called him on his cell phone and he was txing on the DEA's channel with thier PL code! He sat his HT down in the seat and set something on the speaker mic. MMMMMMMAN was he embarased. Lukily i found out who it was be fore they did.

Another problem i have seen(in Fla and MO). People seting on mic's on ploice deparment and fire department freqs. Bad enough that they are txing but they have the pl programed in so they open all the recievers in range! Believe me txing out of band is bad news!

I have a gmrs liscense and have several comercial HT's (HT 600, Pryme PR-460, Relm mpu32, and others). These radios are great! i can program in the freqs in a RX only mode on that channel only..... no chance of TXing on thier freq but allowing me to tx on GMRS, and on the ham repeaters i program into it. the TX inhibit on most ham radios turns of tx on all freqs (when will they get rid of this defect).

i could go on but i will not. Bottom line Dont open up your TX unless your willing to take the chance of Txing where you should not!!!!

Remember Proper equipment works best!!!!!!
Stay legal and free!

Preaching God's Word,
Tom & Lisa Tishken

Keep at it! 15 minutes a day EVERY day will do it in a couple months!

If I can pass it, *anyone* can.

I use the FT-100 to listen on CB, and get all the road information (and a lot of other junk) I need. I carry a CB walkie-talkie for the rare times I need to talk.

Also, monitor 146.52 when travelling. There are a lot of amateur mobiles there.

A very simple solution for the situations you describe (talking on the DEA repeater) is to program the repeater offset in the wrong direction. Every radio I own is modified, and every radio I own has never interfered with the public service or anyone else. [Gee, I sound like an NRA member talking about his guns....]

I simply want every trick in the book available to me. CB is just another trick.

I'll check out the Pop Com issue, but I bet these guys were doing high power. The FCC has no monitoring resources thanks to old Newt Gingrich, bless his adultering soul. Somebody had to alert the FCC. The police jammers around here (SF Bay Area) are found by hams, many who are on the force. Yes, every jammer turned out to be a ham. Go figure.

BTW, I've already gone on long enough and will go back to lurk mode.

The top cover might not be a bad idea, when I talked to the techs at Dayton they stated that it is an easy swap. Just swap the plugs and change the covers. You might want to mention that to anyone who is interested.

I bought the TCXO.....the main reason is because I run packet and also intend to try a little psk31.....even though the FT-100 offers the best "bang" for the buck when it comes to cooling these rigs, I have found from past experience, that it does'nt take much heat building up inside these rigs before you start to see a drift in frequency. That small drift was enough to cause me to have to retune other radios.

Let me point out, I have'nt experienced the drift problem on the FT 100. I just decided to go ahead and put it in anyway based on what I've experienced with other radios. The radio is mounted under my passenger seat, and I figured better to do it now, because it's a real pain to get that seat out. I don't want to do that very often.. :-)

use SSB on the CW sub-bands, etc., even though our rigs are fully capable of

doing all those things; I don't see why they can't trust us not to run 1KW
ATV on the FRS band!

David
WA2BHJ >>

FRS has a very narrow FM deviation, 2.5khz I believe. This deviation is
not possible with most ham gear or will render the rig less than desirable on
the ham bands if hypothetically modified for use there. That plus the power,
antenna size and "package" restrictions makes it even worse to consider a ham
rig for use. The ham equipment (most) would work just fine there but it is
definitely not type accepted.
ATV is also not possible there, the bandwidth for a single color ATV
channel is 6MHZ. Way more than the 14 FRS channels combined plus quite a few
Public service freq's thrown in there for good measure!

The only band with a low power restriction (for all able hams) at 200 watts
is 30 meters (correct me if I am wrong) and that not a "trust issue" with the
FCC. The agreement to use the band carries the restriction of 200 watts as an
international agreement.
I would guess that another country uses the band for another purpose or out
of consideration of interference to another service is the main concern..
Regards.. Richy

Those who doubt that the FCC is active in enforcement may want to take a look at the following web site that contains the text of hundreds of FCC warning/revocation/monetary forfieture letters.

http://www.rrsta.com/rain/ffccenforc.html

In particular, if you're interested in the issue of using Ham equipment on the Citizens Band, see the letters "Walls warn letter", "Christie warn letter", "Cartner warn letter". You can scan all the other letters at your leisure to find any other similar actions.

The particular action I mention above is summarized in

The ARRL Letter
Vol. 19, No. 9
March 3, 2000

"In Salisbury, North Carolina, the FCC wrote Advanced licensees James W. Walls, NC4JW, and Jerry W. Cartner, K4JWC, and Tech Plus licensee James R.
Christie, KF4QWR, on February 24, citing information that the licensees have
been using ham gear on the Citizens Band and other frequencies. The FCC also
alleged they had been selling transmitting equipment that does not meet FCC
certification standards over the air on those frequencies and operating above authorized CB power limits. In separate letters, Hollingsworth warned
all three that such operation could jeopardize their amateur licenses. The
FCC gave the three licensees 20 days to respond to the allegations."

If you want to play "russian roulette" with your license, your equipment and your finances by using your FT100 or other ham gear on CB that's up to you.

This is my last piece of information on this subject. I'd like to let the reflector get back to its real purpose.

Thanks for listening and 73,
John W2KI

Talk to N4TFK, NC4JW, K4JWC and KF4QWR. They were all cited for operating amateur gear on CB. I found these calls with a quick scan of the FCC enforcement log on the ARRL web page.

The ONLY reason that ham radio is better than CB is that most hams respect the rules.
One of the main reasons that many hams opposed easing the entry requirement into ham radio was the fear that if it was easy, new ham would have less respect for the hobby.
This attitude of ignoring the rules you don't like seems to support that fear.

I read about that phone, but this one is different. The phone I am referring to is at the well traveled (ha ha) intersection of 6 and 25, in the near ghost town of Warm Springs. If you visit the area in the winter, you can see the steam rising from the stream, so the town is appropriating named. Take 6 east and you will see the infamous Basecamp, which is the back-up landing strip for Area 51. Take 6 west and you will encounter the road leading to the Tonopah Test Range.

If you use the legal power, proper freq, proper modulation, etc, how can your signal be different that a real CB? Regarding easing the rules letting those with less respect into the hobby, may I point out 2 out of the last 3 jammers shutdown in the SF bay area were general class. The 3rd (KE6JTI)technically never got caught for jamming, but relieved us of his presence by taking an overdose of pills.

Even if you used legal power and proper modulation modes, it would still
be illegal since amateur HF radios have a VFO which is not allowed on CB.

While I like the FT-100 and have had only one problem with it when the
6 KHz AM filter took a dump, it sounds like Yaesu is trying to place blame
on someone else instead of just fixing the radio and making the customer
happy.

I for one missed the net due to the VHF contest that I was pseudo involved in. The net went right by and I did not even think to give a short checkin. I will make an attempt this weekend.
Does anyone else besides me here on the list monitor 18.140 as they drive around // sit in the shack? I would be nice to know that I might be able to work other FT100 users as I head to and from work on that frequency.

On a positive note, now that the ATAS is installed on the truck, I was able to break a pile up on 6 meters as I was heading up the local hill for a 10gig contact that I was going to attempt (my first). Breaking the pile up on 6M was a blast, not to mention the comments "great signal there, FN54"! Cool!

Question:
Has anyone run the ATAS in the horizontal position? (Driven around with it that way // and or flipped it and just worked stuff stationary?) I have not heard anyone mention it here, however, I will comment that on 6 meters changing from the vertical orientation to the horizontal was a major difference in the reduction of man made noise.. not to mention it was now the same polarity of 99% of the antennae working six meters at the time.

I have a feeling that the ATAS would not like tuning in the horizontal position due to the weight loading and such, but I figured that I would ask, maybe there is a Yaesu rep listening in the bunch. (I am not holding my breath)

Sorry to have broke from the "lets take a $1k radio and make it work like a $35 dollar Uniden CB" discussion, but I thought it would be a good question to ask.

Whoops! Did I say that out loud?

Doesn't matter - the FT-100 has not been type accepted for use in the CB bands
and would therefore be technically illegal to operate on 11m.

I say "technically" because (1) the FCC has more important things to do than
to chase 100W radios used on 11m, and (2) there are a *lot* of folks on 11m
who use more than the legal limit.

I wouldn't worry too much about it, frankly.

You missed the point. I don't know of ANY FCC type accepted CB radio
that the TX and RX can both tune any frequency between 26.965 and 27.405
MHz. All the FCC type accepted radios that I've seen can only tune
frequencies in 10 KHz steps or "channels." I'm not getting into the dispute
of whether using your FT-100 on C.B. is a right or wrong personal decision.
I'm just stating what the FCC says. If you choose to use the radio there,
that's your business. Just know that the FCC could come a knockin' and I
don't think, based on previous incidents, that they'd be inclined to see your
side of the issue.

i got the TCXO, because when talking for long periods of time, most radios will drift up and down in Freq as the heat up and cool down. The TCXO will reduce the drift. For instance 10ppm stablity means +-10 hz at 1MHZ, +-100hz at 10 MHZ, and +-300 hz at 30 MHZ. Now if you have a mixer for every mixer you have, it can double the possiblity of drift.

i have seen a lot of Crystal Local Oscilators drift, if your using 2.7khz or bigger ssb filter you will notice it a lot less than 2.1 or 2.3 khz filters. On cw it makes a bigger differance.

Hope that helps a little in why someone might buy a TCXO.

To: FT100@...
Subject: [FT100] CB, FRS, GMRS etc.

Thanks for all the feedback on buying an FT100.

As for the thread that I inadvertently started...

My personal opinion is that it's annoying that the FCC won't type accept ham
radios to be used on other bands that a ham could qualify to use. For example, I'd love to use my HT on the FRS (on low power setting, of course),
but to do that, I have to illegally modify the radio. Seems like an unnecessary restriction. After all, the FCC trusts us to not run more than 200 watts on 30 meters, to keep our power down on the novice bands, to not use SSB on the CW sub-bands, etc., even though our rigs are fully capable of
doing all those things; I don't see why they can't trust us not to run 1KW ATV on the FRS band!

David
WA2BHJ

P.S. Still wondering: Has anyone felt a need to get the TXCO; if so, why?

No matter how much like a CB'er you and your radio may sound, you are still breaking the law if you use amateur radio equipment in the CB band.

Why risk the license? Why risk the high fine?

Do the right thing, for god's sakes.

geez

Are we ever going to get back to FT100 topics?

Rohn - N0RTX

I considered the K400 for my F-150 Ford truck but the weight of the ATAS-100 seems to be to much to depend on the body and threads of a UHF connector to hold the antenna secure. I actually purchased the Comet antenna coax cable with the 90 degree SO-239 fitting from AES and then returned it. The K400 is strong enough but the bulkhead fitting that mounts to the K400 seems too light for the job. Just my 2 cents worth. I hope that it works well for you. I was just tooooo chicken to trust that set up.... I could just invision my $320 ATAS-100 lying on the highway crumbled up and smashed after falling off and getting run over by an 18-wheeler.

My F-150 has a heavyduty 2" square trailer hitch receiver. The receiver is welded to a length of 2"x2" square tubing that runs crosswise across the rear just behind the bumper. I ran a piece of 1-1/2 thin walled conduit from the open end of this tubing and put a bend in it to have it raise up along the left side of the truck bed. Two 3/8-16 set screws with luck nuts hold the conduit in the square tubing. The conduit vertical run then comes up just above the bed rail. A friend of mine machined a piece of Aluminum stock into a bushing and we milled a slot in the side. The bushing slides into the top opening of the conduit which is also slotted 4-ways at the top. The coax cable runs into the conduit just under the truck through a 7/8" hole and rubber gromet and up the conduit, through the bushing and onto the ATAS-100. The base of the ATAS-100 then is inserted into the bushing and I use two #24 stainless hose clamps to squeez the slotted conduit and bushing tight to hold the antenna. So far so good. It has been working FB since I finished the installation this past weekend.

Good luck which ever way you go with it,

73 de Denny AD6EZ <><

From: Keith
Topic: 3747 Message: 3747

If you plan on using a bigger speaker on the FT100, be
aware that if it has good bass response, you WILL hear
any PL tone even if using the PL decoder (unlike most
other Yaesu rigs that filter the low tones when decoding).
And it is pretty LOUD too, not just background hum.
Did someone mention this was changed in the "D" version?

So, FT-100 installed under the driver seat in a Chevy Tahoe.
Well grounded. Using a Mobile Mark heliwhip on the back bumper.
Powered from the fuse block by the brake master cylinder. While
transmitting on 40 meters, the speedometer jumps back and forth
between the speed I'm going and the peg. Pretty neat modulation
indicator, but not what I had in mind. Anyone else with a similar
problem and/or a solution?

well, first don't use the fuse block for power. All of your electronics (ECM, stero, Speedo, head lights and other electronic gages) draw its power through the fuse box. Next look at the wire used to connect to your fuse box(usally 8 to 10 gage). It is not built to handel much more current then normally used but your vehicle. Also most viehcles have a small grouns wire from the battery to the chasie of the vehicle, add a larger cable 8 to 4 gage.

If you mush use your fuse box two suggestions. 1) put some snap on chokes on the power cord as close to the padio as possible with as many turn as you can get. Try 2 to 4 cores together. 2) find out if your RF if comming from your power cord or other sourses.

Yes John, I agree with the frequency move. On Sunday both 18.140 and 18.150 were busy all afternoon. I did not hear any traffic on .153 from my location, did hear a little on .143 about 30 minutes before net time. 14.240 was VERY busy and don't know if the group could find a hole in the frequencies anywhere around 14.240 to 14.260 on a Sunday afternoon.

Yes Jay, I also kept my FT-100 busy on 6M all day. (50 Grids, 21 states, Mexico, and three Canadian Provinces). I had other base radios set on the three frequencies that this net was to meet on.

3754. Installing 6Khz and 500Khz filters

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-13 00:40:56 UTC
From: Chris Barrera

```

I have an FT-100 in which I would have to have the 6Khz and 500Khz filters installed. The 6Khz filter especially to help with SWL and the other for the time when I start practicing code. (I am a no-code tech that also happened to pass element 3B so all that stands between me and my General is my code :)

Unfortunately, I have virtually no experience with a soldering iron. Also, having looked inside my FT-100, it really doesn't look to be the sort of thing I should experiment on at my level.

Having read through the archives, I hear that many have opted even to send it back to Cerritos CA to have Yaesu do this directly. Is this the recommended course of action? For all you people who have done it yourselves, do you feel that if I find someone experienced in soldering, that should work just fine, or was the experience not one you would prefer to repeat?

If I can find a friend to do this for me, I have heard that an early version of the Yaesu instruction manual specified incorrect locations for the 6Khz filter, and am wondering if someone could point out which location is the correct one for that filter.

Appreciate all the help!

Not to sound like a smart alec... but WHY? I don't think you'll find a consensus on something that arbitrary.

Personally, I am forever changing the settings (particularly the noise blanker!) based upon the current band/vehicle conditions. I typically have the CW filter set to the widest position, if that's a help.

It's nice to be flexable.

Incredibly, more often than not, I don't even use the DSP.

Have fun!

From: Powerwerx
Topic: 3757 Message: 3757

Commerical message....

Greetings:

Over the weekend I mentioned about Powerwerx stocking the new FT-100 cover / speaker that now appears in the FT-100D.

Today I inquired about the availability of speaker / cover from Yaesu. They stated that there are no spare speaker / covers in the US and that they will be getting there first shipment of parts in about 3 - 4 weeks.

I will update the list when they become available. Regarding the price they do not have US pricing as yet.

Since quite a few people have been asking for the radio end (female) of the power connector for the FT-100, Powerwerx is now stocking these connectors, I will get them up on the web site in the next couple of days.

From: Arin Ianis
Topic: 3758 Message: 3758

After on day of operation of the Ft-100 and atas 100 the antenna is stuck in the extended position . I tried to reset the antenna with the
keying of the microphone and the up/down button, no help.
I reset the radio a couple of times, when it comes up after reset the radio goes automatically in tune mode and after a while comes back with no result, the antenna is still stuck in the extended position.
I changed the cable between them with a longer cable- the same,I have good grounding at the antenna and at the radio, I have chokes on the cable to the antenna at the radio and at the antenna, at the microphone and at the external speaker.
Any advice please, is there any thing I can do before sending it back, which one is bad- the radio or the antenna.??
Thanks

Check the bottom of the antenna with an ohm meter. If it doesn't read around
28 ohms, send it back. It happened to mine when I first got it.

I have just received a Cubex Quad ant. from FL, ordered by email (difficult
to
obtain a good one in the UK) at a cost of some $400 including $100
airfreight. Upon
collection at my local airport, I was charged a further $215 for handling,
customs clearance, duty, tax etc.etc.

Is that a good deal ?

Dave,
I have a 2000 Explorer with the ft-100 mounted in the drivers rear compartment. That is where the jack is stored. It sits on a piece of foam. Ground strap and dc ground go to the bolt holding the right rear seatbelt. Dc + and all control wires continue on under the molding at the rear door, then under the molding at the front door. DC+ then goes though the fire wall to the Battery. I used heavy duty Velcro to attach the face to the dash under the climate controls.
I used a Diamond mount to mount the atas on the luggage rack (rear right) I'll have to look up the mount for you. It is meant for mounting to a pole, or mirror pole, etc. It came with very thin coax, about 6 feet then changes to rj59 for another 6 feet. In order to tune 40 m I had to add about 12 feet of rj59 and I coiled all the excess cable in a 8" coil held with wire ties. Now it tunes with no problem. I use a separate antenna for vhf and uhf.
Let me know if you need more info.

I also received my order of a new Atlas 100 and following all the suggestions of the many posting here about grounding got a complete surprise when I hit tune and it went out and stopped at the 20M band that the radio was on. Tuned radio to 40M and hit tune and antenna screwed all the way out and stayed there. No way to get it to tune any longer. Needless to say it went right back in the box and this morning I got UPS tracking number for what I was told is a new antenna being shipped.

I have talked with two others on the air that had identical problems with the first Atlas 100 sent to them as well.
Hope the next one works correct.

I never even got to transmit into the antenna and it failed.

Arin,

I've had to return the antenna to Yaesu a few times in the past year... they are usually good at replacing and/or fixing the problem. In one case, I had an IC that failed.

The biggest problem is the delay and cost of sending it back... no HF for a few weeks each time.

73's,

Geoff

I don't know if it will help or not, but you stated:

"I tried to reset the antenna with the keying of the microphone and the
up/down button, no help."

The manual tuning of the ATAS-100 is instigated by keying the mic and
the up/down buttons on the face of the radio.

The manual is not clear on describing this.

Not exactly a roof mount, but two of us are using a system that is working well for a trunk lid mount.

A 5/8" hole drilled through the center of the trunk lid in the area where the inner shell is separated from the outer skin by about 1 1/4". A bulkhead connector (a long barrell mount) is inserted with muts on either side of the outer skin. The bottom hole is enlarged to accomodate a deep socket to tighten the inner nut. On the inner shell a large washer with a 5/8" hole is secured to the bulkhead connector with two more of the skinny 5/8-24 nuts. The washer is secured to the inner shell with sheetmetal screws. A large 3/4" hole washer on the top serves to stiffen the sheetmetal on top, provide clearance for the nut and provide a base for the ATAS-100. Some up/down adjusting is necessary to provide a tight, solid connection to the female threads on the antenna. This provides a solid mount for the antenna.

The usual grinding around the holes for good ground, a good deoxidizing compound to help with waterproofing and liberal grounding of the automobile body parts with flat braid ground straps. An appropriate "o" ring in the center of the top washer helps too.
As with most mobile antenna mounts, occasional maintenance is necessary to maintain resistance to corrosion. Expecially in the winter when salt is used on the roads around here.

Also loosened the trunk latch so I can close the trunk lid by pushing down instead of slamming the lid. The length and weight of the ATAS-100 can loosen the mount with slamming of the lid.

Can send photos on request (e-mail)

I worked the VHF QSO Party this past weekend with my Ft-100 as a warm up to our Feild Day. Rig did a fantastic job on all 3 bands as a stand alone(no preamps, amps, nothing but my FT-100). For those of you worriied about Field Day preformance, DON'T. Radio stayed cool and had no drift dispite being worked hard on both 2 meters and 6 meters with nearly continous transmitting on either band for hours at a time. This would also give the impression that unless you were in a high heat area all of the time that the TXCO unit is not needed. Just a little more praise for a rig I couldn't be happier with.

well here is the update on my new ft100 rig received on 5/14/00
was sent in to yaesu for repairs on 5/22/00 for the high swr icon on
12/10 meters was received back here on 6/5/00 was tested out found still
had the 10 meter oscillation when rig was first keyed at cold start also
found 6 meters was unusable when the heat sink warmed up due to high swr
icon and power being cut back. i was even able to get the 6 meter
problem to duplicate with a dummy load this time. so rig is now on its
way back to yaesu again for service on 6/14/00. sure hope i dont get any
problems with the atas100 antenna i just installed. needless to say this
can be a very disappointing thing

Ok, found out on my ATAS-100, that if I want it to tune on 6 meters it is better to go to 20 meters and let the antenna lengthen out. Then have it return for 6 meters and the radio is
happy. I don't understand why it wants to do this but it works, particluary when you have had it retracted all the way for 2m,440 operations. I have found I am going to go with a seperate antennas for 2/440 however.

I have to go to the book again, but is there a way to make 6 meters come out on the 2/440 side?

Ron,

I belive retracting the antenna completely for VHF/UHF is the intended mode of operation for the ATAS-100. If you are using a duplexer (as recommended) and have the antenna/tuner setting correct, then the ATAS will retract all the way when you press the TUN button while in VHF or UHF. Remember, the tuning voltages to the antenna come from the HF connector (even though the RF goes through the other), so the duplexer will need to be able to pass this voltage if used.

I think your choice to use a seperate antenna for VHF/UHF is well-founded if you need any performance on these bands at all. If you look at the polls, many other users have found this out too. Anything above 1/4 wave on a seperate antenna will offer improvement over the ATAS-100 (although the ATAS may actually perform worse than 1/4 wave on these bands). I use seperate antennas because my repeaters are difficult to hit from my commute. Others here in San Diego have no problem hitting the repeaters from their most likely travel paths, so the ATAS works fine for them.

Operate FT-100 in 1999 KW T-2000. Can't use 40M if engine is running. Several gauges, including pyrometer, speedometer and oil temp gauges jump all over the place. It also causes a fault alarm on our satellite system resulting in the company getting a panic notice from the truck. The FT-100 is will grounded, and shielded. Thought it was just a quirk in the truck.

So, FT-100 installed under the driver seat in a Chevy Tahoe.
Well grounded. Using a Mobile Mark heliwhip on the back bumper.
Powered from the fuse block by the brake master cylinder. While
transmitting on 40 meters, the speedometer jumps back and forth
between the speed I'm going and the peg. Pretty neat modulation
indicator, but not what I had in mind. Anyone else with a similar
problem and/or a solution?

In my travels :) I've heard of more strange anomolies arising from the transmissions radiated from 40m than any other source. Mine triggers the electronic sprinklers in my yard. It's kinda funny to hear the water hammer pounding with the SSB power peaks while on 40m.

I've tried filtering at the source for these to no avail. Putting chokes on the power lines of the phones, stereo speakers, and sprinklers was the only solution to these types of problems, but the neighbors still call and give me signal reports from their electronic monitoring devices (i.e. phone, stereo, garage door opener, etc). As a neighborly ham, I just drive to a local hill and HF only from my car now. Kinda like QRP, mobiles are a more rare contact (at least I like to think so).

If you ever want to break into the neighbor's garage, key up on 40m, and their door just may open :)

Ford is aware that 40m interrupts the smooth operation of its Taurus. The
fix is a ground braid attached to the Mass Air Flow sensor, a big black box
in the engine compartment.

3790. noise

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-15 13:23:59 UTC
From: Pres Waterman
Topic: 3790 Message: 3790

I have heard on the list a comment that the setting on the noise blanker in the FT-100 goes from zero to Ford. Well, I sure believe it now. In my 2000 Taurus as well as a friend's 2000 F-250 the ignition noise is unfathomable. I had an engineer come out yesterday and before he found me he went to the truck, actually figured out how to use the FT-100 and pronounced the noise "normal" because it wasn't above 30MHz and Ford feels they have no niose above 30. He wasn't aware to tune the antenna to 6m so I showed him the noise goes waay above that.

In fact, I found in my Taurus it exceeds 600MHz! And I had a friend who is a cell site engineer bring out a spectrum analyzer worth as much as the truck, and showed the Ford guy the noise goes to almost 500MHz on the F250.

The bad news is that although the noise certanily is strong near the coils, it also seems to radiate from everywhere... even the body panels. This suggests that is it being generated on the ground side of the circuit... more on this later in the message.

He just stared at the truck for an hour, thinking and taking notes and he is going to speak to the engineers.

It's amazing that Ford hasn't had complaints (at least that's what they say) but niose like this HAS to hurt 46MHz radios, as well as hi-band. Maybe no problem at 800MHz. But Ford certainly has a lot of clients in public safety.

But also amazing is that I have had the FT-100 in a 1999 Crown Vic and a 1998 Expedition. No real problem noted. Well, the noise blanker is effective anyway. But in my Taurus I have trouble hearing 10m FM because f the noise.

By the way, I have learned a lot about the noise source... they have gone to a COIL-ON-PLUG design. No more cap-n-rotor, and not even a distributorless ignition module. The engine processor fires individual coils on each plug. They are wired like this... positive is common, with one bypass capacitor to ground per side (shared on 3 or 4 coils in a 6 or 8 cyl), and the low side of the coil is grounded by the processor when it needs to fire. I discussed with the field engineer the possibility of a diode or capacitor across the coil and he said the system depends on a fast-collapsing field to fire. At least he understands electronics.

Ford has suggested a lot of cockamaimie ideas such as groundnig the tailpipe. The only thing at this point that sounds plausible is to take a bunch of coils and hand-pick the ones with the highest resistance and put them in. They said the coils range from 2k-20k ohms (presumable the resistance from the positive input to the spark plug output) and find the ones reading 20k. Well, the 2 coils I had in stock were exectly 5.46k ohms... hardly a range to look for.

Has anyone faced this and solved it? I know... "see your dealer for details"... well, I *AM* the dealer and I'm stumped.

My problem with my 97 Grand Prix is wide-band (40M through 15M)S9 noise from the anti-lock braking system. If I pull the ABS Conputer fuse, the noise goes away. GM engineers at the Milford proving ground have been unable to suggest a fix.

GM is quick to tell everyone that RF hash comes from the fuel pump, and for a couple hundred bucks you can replace the sending unit with a filtered device, but my noise is absolutely coming from the ABS computer system. The fuel pump is quiet.

The ABS computer was replaced under warranty early in the car's life.

Any suggestions (other than replace the car) would be greatly appreciated. I don't want to drive around with the ABS disabled either. :-)

3795. Noise Blanker on 2m SSB?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-15 14:26:36 UTC
From: GW
Topic: 3795 Message: 3795

Without a doubt I love my little FT-100. It has served me well
for the past couple of months, & I hope it continues to serve
me for many a good year to come. Recently I discovered
while on 2m SSB, that the noise blanker does not seem to
function. I understand that it does not function on 2m FM, this
is understandable, however, shouldn't it work on USB? I
suppose the fault lies in the radio's firmware, as it probably
doesn't check for mode, but rather for band. Luckily, my Chevy
truck is very quiet, as noise levels were only S1, but still heard a
slight ignition noise upon acceleration. Otherwise while on 6m
the noise blanker performs beautifully! I was just wondering if any
else noticed this little quirk.

Thanks,
Gary KC2GKL

3796. Re: RF in the speedometer!

Yahoo group: FT100 (1998 — 2000)

From: Mr. Z
Topic: 3749 Message: 3796

Well, since I originally asked this question I have tried a couple of things. I put a cantenna (dummy load) on the output of the FT-100 instead of the mobile antenna to see if the rf was being radiated into
the speedometer by the antenna or going back through the power cord. The speedometer didn't budge. Then, I tried an rf choke in series with the mobile antenna. This choke consists of about 40' of RG-58 wound around a piece of 4½" diameter PVC pipe. This choke cannot lay
down against the metal of the vehicle, it has to be perpendicular to any metal surface. Standing up under a back seat works well. I tried it with the engine running, but the vehicle was not moving. The speedometer didn't budge. I will try it with the vehicle moving later today or tomorrow and post a report and picture of the choke for anyone who cares. Thanks to all who posted advice! GO FT-100!

Pres, there is a long standing issue with Ford electic fuel pumps. Is it possible that you're hearing that source of RFI - either in addition to or as opposed to ignition noise?

I can provide you with the Ford part number and appropriate Ford service bulletin numbers if you think there's any merit to the effort.

3799. Fitting an extra IF filter - long message

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-15 15:33:33 UTC
From: Tim G4WIM
Topic: 3799 Message: 3799

Some notes on installing an additional IF filter within an FT-100.

Having completed this modification successfully, I now understand why the FT-100D has many of the options fitted as standard ! Read on.....

Following the instructions in the handbook sounds straight forward enough, but I hope the following will help others succeed.

Step 1,
Removing front panel, microphone and top cover - no major problem here, but be aware the speaker wire is very short.

Step 2,

Removing the six screws holding the PCB in place - make sure you have a good fitting screw driver as the screws are threaded directly into the die cast chassis and the screw holding the TO220 package in the top left corner can be very tight.

I would also recommend disconnecting all the specified connectors before removing these 6 screws. You will have to move some cables out
of the way to access some of the screws in any event.

Step 3,

Not mentioned in the handbook is the need to desolder the 'green jumper wire modification' which runs from the IF PCB directly to an IC pin within the transmitter section.

Step 4,

The handbook says to remove the coax cables and ribbon connectors as indicated. It does not explain how to remove the ribbon connectors. First you have to lift the upper plastic moulding by about 2mm, then the ribbon cable comes out real easy - just pulling on the cable does not work.

Step 5,

Having removed all the screws and cables etc it is now possible to lift the PCB forward and fit the filter of choice. Even this is quite
fiddly as there are a number of cables which run in that area making it somewhat difficult to locate the filter on the PCB. Actually soldering it onto the PCB is no big deal.

Step 6,

On trying to re-assemble the rig I discovered a number of minor problems. After re-locating the PCB and loosely putting the 6 mounting screws in place, I found that just to the left and above the added filter is a coax connector and cable. The cable was now too short to reach the connector as it has to route around the new filter. To fix this I had to remove the bottom cover of the rig and pull a little extra slack through - fortunately Yaesu had left some slack, presumably for this reason.

Having finally got all the connectors back in place (making sure the mouldings on the ribbon cable connectors were
raised for easy insertion), re-soldered the 'green wire mod' and tweaked all the screws back down, I found the routing of the two coax cables in the top left corner under the speaker to be very critical. It is necessary to make sure these are tucked down so they don't foul the loudspeaker. Also make sure the ribbon cables at the front of the
rig can lie down flat - you may have to push some coax cables down in front of the newly fitted filter.

Step 7,

Replace both covers - make sure the top cover fits ok and no cables are causing it to be raised up. Activate the filter as per instructions.

Tested the rig and everything worked fine.

Took about 1.5 hours to fit this filter, but well worth it for the extra selectivity when running PSK or CW on 20 mtrs.

While doing the mod I noticed alot of surface mount components around the mounting screws and on the PCB - it would have been very easy to damage one of these parts and cause all sorts of problems.

IMHO, for this reason, I would not reccomend this modification to anyone who does not possess a reasonable level of practical ability.

Hope this helps out fellow FT-100 owners

Regards

Tim AD6OP (ex G4WIM)

Subject: [FT100] Noise Blanker on 2m SSB?

Without a doubt I love my little FT-100. It has served me well for the past couple of months, & I hope it continues to serve me for many a good year to come. Recently I discovered while on 2m SSB, that the noise blanker does not seem to function. I understand that it does not function on 2m FM, this is understandable, however, shouldn't it work on USB? I suppose the fault lies in the radio's firmware, as it probably doesn't check for mode, but rather for band. Luckily, my Chevy truck is very quiet, as noise levels were only S1, but still heard a slight ignition noise upon acceleration. Otherwise while on 6m the noise blanker performs beautifully! I was just wondering if any else noticed this little quirk.

Thanks,
Gary KC2GKL

Just a note also people, the Chevrolet Cavalier Z-24 models (1996, 1998) that I've owned in the past had wicked fuel pump noise of +9 over on my TS-50, and +1 to 3 on the FT-100 and a little less on the IC-706G. GM told me they were unable to help me.

Pres, there is a long standing issue with Ford electic fuel pumps. Is it possible that you're hearing that source of RFI - either in addition to or as opposed to ignition noise?

I can provide you with the Ford part number and appropriate Ford service bulletin numbers if you think there's any merit to the effort.

Topic: 3802 Message: 3802

For those not plagued with Ford electric (got it right, this time) fuel pump generated RFI, hit <DELETE> now. What follows is info gleaned from another reflector's archives and is on point with regard to Ford's fuel pump RFI issues:

Here's the first reference, quoted in it's entirety:

"Ref: Ford Technical Service Bulletin: 98-7-3
"Fuel system - fuel pump: whining/buzzing noise comes thru 2-way radio speakers"

Vehicles covered:

Ford
1990-93 Tempo
1990-97 Probe, Thunderbird
1990-98 Escort, Taurus
1990-99 Crown Victoria, Mustang
1997-98 Contour

Lincoln-Mercury
1990-92 Mark VII
1990-93 Topaz
1990-96 Continental
1990-97 Cougar
1990-98 Sable, Town Car
1990-99 Grand Marquis
1991-98 Tracer
1997-98 Mystique
1997-98 Mark VIII

Light Truck
1990 Bronco II
1990-96 Bronco
1990-97 Aerostar, F Super Duty, F-250 HD, F-350
1990-98 Econoline
1990-99 F-150, F-250 LD, Ranger
1991-98 Explorer
1993-98 Villager
1997-98 Expedition, Mountaineer, Windstar
1998 Navigator

The Problem:
Electrical noise on radio speakers caused by in-tank electric fuel pump.

The Fix:
Installaition of an RFI filter (Part No. F1PZ-18B925-A) on the
fuel pump inside the fuel tank. *Note: some light trucks may require
one RFI on each fuel pump on multi-tank vehicles.

Test Procedure:
Fuel pump radio noise is relatively constant and changes only slightly
with vehicle speed. If the frequency of the noise varies, or the noise
comes and goes with vehicle speed, then it is NOT the fuel pump, and
this fix will not be effective. Use the following procedure to determine
if the fuel pumpis the cause of the radio noise.

1. Turn the radio on.
2. Turn the ignition key to the RUN position, but do NOT start the engine.
3. The fuel pump should run for about 1 second with the key in the RUN
position with the engine not running. Listen for noise in the radio.

If the noise is present while the pump is running, and stops when the
pump stops, then the noise is being generated by the pump and this
procedure should help."

The second reference is to what appears to be a citation of 1999's service
bulletin series
(Ford's, of course):

"Service Bulletin Number: 99-12-9"

And, finally, these words of encouragement from a satisfied Ford customer:

"The Fords RFI filter works great in my 1993 Explorer. The trick was also to
cut the pumps ground wire and run it to the cars frame about 1 foot away. If
you dont do this then the ground wire runs to the front and is about 5-6
feet long acting like an antenna for noise pick-up
The part number is
RFI Filter F1PZ-18B925-A"

From: emoxon@alum.mit.edu
Topic: 1969 Message: 3803

I keep getting more familiar with the innards of the ATAS-100, and thought I would pass along one tidbit, for what it's worth.
When the antenna is fully retracted, the whip is 'disconnected', i.e. there is no galvanic connection between the whip and the stalk. The spring-loaded contacts at the top of the stalk no longer touch the coil wire, they ride on bare fiberglass.
There is still some coupling to the whip, and I can see a difference in swr on 2 if the whip is taken off.
But I had imagined it was turning into one continuous rod, and that's not what's happening.
(This seems like a good place for a reminder about the FAQs -- there's a great description of the insides:
http://members.aol.com/lee810/ft100faq.html#atasdis).

Great turnaround from Yaesu...

Sent my ATA-100 back for repair, and it was returned (with a new matching unit) within a week! I overnighted it, and they 3-day returned it... so they must have tested and replaced the same day it was received.

Service like this makes it a pleasure to do business with Yaesu... I just wish the antenna didn't fail in the first place!

3805. Re: K400 mod for Dodge Caravan?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-16 00:31:14 UTC
From: Rohn
Topic: 3742 Message: 3805

I saw the response suggesting that I get a trailer hitch for my Grand Caravan and homebrew a vertical extension off the side to mount the ATAS-100 on... I am appreciative of the suggestion (and any other alternative), but I was wondering if there was anyone still on the list who could give me some info on the K400 modification mentioned below?

Thanks again

Hi Ed,

I suppose this means that the whip is capacitively coupled to the coax,
similar to the way that a through-the-glass antenna works. Perhaps it's part
of an L network to help adjust the SWR to be less than 3:1 on both the 2M and
70cm bands. I'll add this to the FAQ under the ATAS disassembly section and
if anyone would care to add anything about the theory of how it all works,
please feel free to jump in.

Thanks,

3807. FT-100 / Won't Factory Reset

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-16 02:57:27 UTC
From: James Pope
Topic: 3807 Message: 3807

I have a friend that has (1) FT-100 in his truck and (1) in his residence as a base. They were purchased about three months apart from different suppliers. His problem is neither one of these radios will do a factory reset. I have been present when he attempted doing a reset on both radios, and he followed the procedure set in the Yaesu book without fail. I have an FT-100 and the procedure worked fine.

Anyone else had this problem or know how to correct it. He contacted Yaesu and of course they were of little to no help and wanted him to send both of them back. Any help or advice would be of great assistance.

Thanks
73,
KC0DND

3811. Usign FT100 on Satellites

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-16 10:23:35 UTC
From: Stan Schretter
Topic: 3811 Message: 3811

I am trying to set up a very portable station for the upcoming P3D. Since I am a volunteer op at the Smithsonian station in DC, my intent is to possibly demo satellie ops outside on the mall. The FT100 looks like a great rig (split 144/430 mode) for that but not sure if I can use computer based "true doppler" correction needed since I can't hear my own signal to tune out the doppler. That requires that I always have access to BOTH vfo registers via the CAT interface (normal ops for most full rigs). Note that the IC 706 will NOT support this mode - it only gives access to one register (the one being currently active!!).

Can someone tell me if this is possible using the FT100. My long term intent would be to create the doppler control program using the Palm Pilot - for really portable CAT operations!

Thanks and 73
Stan W4MQ

3812. Losing RX gain

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-16 12:35:52 UTC
From: W4TGA
Topic: 3812 Message: 3812

I recently installed a new FT100 and in the past few days have noticed that after the unit is on for 5-10 minutes that the receiver appears to lose gain. You can demonstrate this by listening to the background noise or signals on any of the HF bands, turning the unit off for 15-20 seconds and turning it back on. When it comes back on, the noise level and signals are loud, but in a few seconds both fade to a much lower level.

Has this been seen before and is the a fix for it??

Thanks,
Barry W4TGA

? What split 144/430 mode ? in an FT100?

This sounds like the DSP noise reduction is turned on. It takes a
second or three for the DSP to lock onto noise and cancel it out.

I am using a "ClearSpeech" DSP speaker on my FT100. It is so effective
at removing white noise and static bursts that I often end up at full
volume without realizing it!

Where did you find your Clearspeech DSP speaker? I looked on their
webpage, but only saw headphones.

Thanks!

Shannon

Pres, there is a long standing issue with Ford electic fuel pumps. Is it possible that you're hearing that source of RFI - either in addition to or as opposed to ignition noise?

I can provide you with the Ford part number and appropriate Ford service bulletin numbers if you think there's any merit to the effort.

73

de Brad W9FX

PRES>

I should have specified more clearly that this is not the fuel pump issue. Of if there IS a fuel pump noise you would never hear it under the ignition noise!

Fuel pump is easy to diagnose. Turn the key to the RUN position without cranking and starting the vehicle. You will hear (in Fords at least) a one second buzz that stops, then returns when the vehicle is running.

This is a pop-pop-pop that varies with engine RPMs, which would not be the case if it was fuel pump.

The Ford fuel pump filter F1PZ-18B925-A works magic on pumps. I would be glad to sell them to the list at a discount (about $45). And if it is fuel pump noise on the GM products I don't see why it wouldn't fix it. Even the ABS problem. If it is a buzz-hash noise think it might work.

This noise I face in 2 vehicles is pop-pop coming from the individual coils on the spark plugs. I will say that the noise blanker gets rid of it, I just wish it worked on FM!

Please, for someone in the UK not too sure about my approbation to the adjustments to the English spoken tongue, what is a "galvanic connection" ? My Pocket Oxford Dictionary states that it (galvanic) is "the production of an electric current by chemical action".

If this is a true application of the word then it might seem to be the cause of all the difficulties attributed to the problems to be found with the ATAS100 i.e. water penetration !!!!!!!!!

As always,

Andrew G3OUT

The word galvanic should of been omitted, or at least the word ohmic used. Iron and copper make a galvanic connection. My plumbing can testify to that.

I had brought this up a while ago, but got little feedback. Has anyone considered using an isoloop design versus the ATAS100. The isoloop has a variable capacitor, which is a reliable tunable element, though it still has wipers.

3820. ClearSpeech filter website and testimonial

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-17 02:27:39 UTC
From: John Shalamskas
Topic: 3812 Message: 3820

I bought my ClearSpeech DSP speaker at the PacifiCon hamfest last year. Since then the price went up, so it was a good investment :-).

http://www.amateurcommunications.com/

The speaker is pictured at the top-right quadrant. If you have a speaker already, you can buy just the DSP unit instead. I might have done that if it was available when I bought mine. The speaker does have an audio output on it which is meant for driving another speaker, so the flexibility of having the built-in speaker is nice. The audio quality of the speaker is decent, but I have heard better speakers. In the long run, I plan to use an FM radio modulator ($20 at Best Buy) to inject the output of the ClearSpeech into my car stereo, which has plenty of audio output, and adjustable bass/treble. That will also remove one more speaker from view. If you are doing this, or plan to use headphones with it, you'll need to use an attenuator in order to protect your hearing and the headphones/modulator from damage.

I use the clearspeech DSP filter full-time; very infrequently, I also add the FT100 noise reduction function (not cranked up very high, either.) The automatic notch filter on the FT100 kicks in much faster than the ClearSpeech, but doesn't have nearly as much attenuation. The ClearSpeech DSP is meant to pass through short tones like CW, but completely squashes any tones lasting more than about 750 milliseconds. I have found that the ClearSpeech is not very useful for CW, your mileage may vary (YMMV). It softens the CW attack/decay quite a bit, and practically eliminates sidetone output. It should have a CW mode with no auto-notching and less aggressive noise filter, and an SSB mode with an optimal auto-notch. Maybe they'll add that to the next model. Good thing the FT100 has a CW-friendly noise reduction mode!

Having two different sets of DSP filters results in some pretty amazing audio filtering capabilities. For example, if you want to hear WWV without the continous tones, the two DSPs in tandem (ClearSpeech + FT100 auto-notch) will strip out the tones and static, leaving behind only the clock tick and voices. Occasionally, this arrangement has made the difference between copying 100% or not at all. The main benefit, though, is greatly reduced fatigue, and therefore, increased enjoyment of an armchair QSO while driving on a crowded highway. It also means more attention can be focused on your driving, instead of trying to hear signals through QRN.

I am starting to sound like a commercial, but it's really quite amazing how far DSP audio filters have progressed. It's like magic! The affect on speech is negligible, and it even helps to pull signals out of the mud, which my first DSP filter failed to do (it probably needed to use

higher resolution sampling, which is now commonplace.)

I have the NB on but not the DSP NR. It seems to be heat related as it takes about 5-10 minutes before this starts to happen. However, I will try running with the NB off and see if that offers any improvement. Thanks for the suggestion.

3823. Re: Opinion of illegal use?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-17 02:53:10 UTC
From: Steven Jepsen
Topic: 3783 Message: 3823

It's clear from the responses to my post and a couple of emails I received that I didn't craft my message very well.
I do not, nor have I ever intentionally violated FCC rules. I'm proud of my ham license. My radio is unmodified and will stay that way.
My question was brought on by the lack of response to a number of messages on this board about using the FT100 on CB. I feel that the lack of response to these messages amounts to tacit approval of this kind of illegal operation.
I would hope that the general attitude of this group is that such operation is illegal and should not be condoned. When a message advocating such operation is posted there should be a strong negative response.

> I'm just curious. What is the general opinion the group regarding
> illegal use of this radio. (CB, Free band, etc).
> From the tone of some of the messages I'm begining to wonder how
> much support there is for this sort of thing.

I had been a 'Ford man' for many years and the only way I was able to solve the persistent RFI problems was to buy a Dodge. I now make it a point to test drive a vehicle with a ham radio to see if the engineers were even paying attention when they tested their vehicles for EMI compatibility. When you tell an auto manufacturer that their lack of attention to this detail will cause you to buy a vehicle from their competitor, they may begin to realize its importance. We need to let them know that if they can't solve this problem, we'll find a competitor who is able to do it...and we'll let all our ham friends know about it too.

I am an advocate of a web site that warns ham radio operators about purchasing vehicles that put out so much RFI that their radios will be overwhelmed with it. I'd even volunteer to collect and distribute the data. It would benefit the ham community and auto manufacturers in the end.

Stan,
I have used my FT-100 on UO-14, AO-27, and SO 35 with good to fair success. This coming from a person with no sat experience at all prior to opening the box on my FT 100 in Febuary 2000. And some here say it couldnt be done. I have not used it with the CAT software though and look forward to hearing more on how you resolve the problems.

3826. Dynamic Mics

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-17 11:32:32 UTC
From: Bill Clarke
Topic: 3826 Message: 3826

Tried to post this earlier - got lost someplace.

Anyone having luck with dynamic mics on the FT-100? Specifically, either the Yaesu desk mic or a Heil #5. Get sufficient drive? Good full audio? Good power output?

Thanks, Bill W2BLC

Well, I turned off the NB, the DSP NR was also off, and no change. Still
the reduced RX gain after about 5-10 minutes. Absent any other suggestions
it's back to Yaesu. Thanks for the try.

Wow, I wonder why they removed that feature! It is really handy.
I suppose that it wouldn't be too difficult or expensive to add an
external speaker jack with automatic cutoff, but when I pay $150 for a
unit like that, it should have this sort of feature to begin with.

On the other hand, I hear that the new units have more audio output,
which I would find helpful at times.

3830. North American mains supply wiring

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-17 15:52:02 UTC
From: Bob Sayers
Topic: 3830 Message: 3830

Hi, All;

Very slightly off-topic, but it IS required for a mains lead for a dual-mains-voltage switched mode PSU, which I want to bring with my FT-100 to Canada and the US on a visit in the fall.

I'm looking at a Canadian three-pin mains plug, of which the "odd" pin (presumably earth) and the left-hand pin (viewed from inside) are brass coloured, the other one being silver.

How is the plug wired? On UK plugs, the central "odd" pin would be earth, the right-hand one live, and the left-hand neutral. Are North American plugs wired to the same convention?

Bob, G8IYK

We use a U-Ground cord cap. The Male is U = Ground
This is the longer one and is the Neutral l 1 = Shorter or brass colored
is the hot. This drawind is looking at the cord cap with the prongs
facing you. I hope this helps.

Ah! Yes, you have found the one weak link Yaesu let the Icom 706 beat them with. The 706 allows you to use the UP DOWN buttons on the microphone as electronic keyer paddles! I can say that in my limited experience with the 706, the buttons worked quite well!

I wonder if Yaesu fixed this unfortunate "blunder" with the FT-100D?

OK, HF 2.5 is narrow deviation only on HF but normal 5 KHz deviation on 6 and up. The 2.5 setting is narrow on all bands. 5.0 is the normal 5 KHz deviation on all bands.

HF 2.5 is a nice setting for overall use.

3843. Oscillations on 40 and up

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-19 01:11:43 UTC
From: Bill Clarke
Topic: 3843 Message: 3843

I put the 100 in my travel trailer and have oscillation problems on 40 and up. Installation is exactly the same as I used on my 706 (never had any problems). This thing even gets into the AC unit - no joke, it turns it on with the master in the off position!

I tried a different antenna and better grounding at the antenna - no improvement.

The wiring comes from the battery and the antenna - both mounted on the tongue and about 12 feet of wire for each. Again, same as with the 706.

Next try will be a 5 foot braid from the chassis of the rig to the trailer frame.

If this doesn't fix the problem I can always use the rig as a paper weight!

Any other ideas would be appreciated.

Bill W2BLC

Bill.....get a ferrite donut about 3 or 4 inches in diameter with a two inch inside diameter. Wind 4 or 5 turns of coax around the donut just before the antenna. I think this choke will prevent your problems. I had similar problems with the dash meters jumping on 40 meters until I put the ferrite donut choke on...Dale KC2PZ

Bill:
When you say oscillation problems, are you referring to the radio acting up or just the radio getting into other things? If it's the radio that's "oscillating" on some HF bands, try disconnecting the VHF/UHF antenna connector from the antenna and try it on HF again. If the rig works much better on HF with the VHF/UHF antenna connection disconnected, then you have a problem Yaesu is aware of and can fix. Send it in for warrantee work.

I put the 100 in my travel trailer and have oscillation problems on 40 and up. Installation is exactly the same as I used on my 706 (never had any problems). This thing even gets into the AC unit - no joke, it turns it on with the master in the off position!

I tried a different antenna and better grounding at the antenna - no improvement.

The wiring comes from the battery and the antenna - both mounted on the tongue and about 12 feet of wire for each. Again, same as with the 706.

Next try will be a 5 foot braid from the chassis of the rig to the trailer frame.

If this doesn't fix the problem I can always use the rig as a paper weight!

Any other ideas would be appreciated.

Bill W2BLC

that is what i thought, but in the HF 2.5 mode it seems to be 2.5 on 2m and 70cm. Infact when in the HF 2.5 mode they say i am about half as loud, then in the 5.0 mode. Shouldnt the dev stay the same (5.0) on 2m and 70cm in either HF 2.5 and the 5.0 setting?

I thought it ment 2.5 Khz on HF and 5.0 on V/UHF
Where the other settings of 2.5 mean 2.5 on all bands and 5 means 5 Khz on all bands.

3851. intermittent PA oscillation cured! (long)

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-19 20:03:09 UTC
From: John Shalamskas
Topic: 3851 Message: 3851

Hello from John, KJ9U!

In the past, the power amplifier on my FT100 has shown intermittent signs of spurious oscillation. It might show 70 watts out during tune mode; the ATAS-100 may not find a low SWR spot even with manual tweaking; and once or twice, it actually fried an IC in the ATAS-100, which caused the tuning coil to stop moving up or down.

The second time that the ATAS looked like it was broken, I sent both the FT100 and ATAS-100 to Yaesu. Thanks to a posting by Jeff Sherman <k7xq@...> in this forum, I requested the addition of a soldered ground strap to the low-pass filter module at J5015. I received a phone call from the Yaesu technician, saying that he had installed the extra grounding even though he was unable to duplicate the above problems (which were intermittent, and therefore difficult to duplicate.) With the soldered, low-inductance ground connection to the low-pass filter module, I have not seen any more symptoms of spurious oscillation in 3 weeks of daily use. The rig is working as advertised, with a diplexor combining the HF/VHF outputs into the ATAS-100. It has been a real joy to have it working reliably on all bands.

I still haven't double-checked exactly what was done. Sometime in the next week I will be opening up the case in order to crank up the CW sidetone level. The grounding that was added should be visible then. If I can find a digital camera, I'll post a picture of it.

I also have been steadily improving the external grounding of the rig and ATAS, which the Yaesu technician strongly recommended when we spoke on the phone. The FT100 is mounted to a metal stiffening spar in the trunk. The spar is welded to the sheet metal of the automobile body. I have removed the paint in a 1/4 inch radius around all screw holes. I stopped using the black screws supplied by Yaesu for the mounting bracket, and went to stainless steel screws instead. Lockwashers with multiple sharp teeth are used on all screws. I have also added a 1 inch wide tinned copper braid between the mounting bracket and the trunk lid, and a 1/2 inch braid jumper between the trunk lid and the ATAS-100 itself. The braid is screwed onto the ATBK base kit with no radials, bypassing the questionable grounding of the Diamond trunk lip mount. In case you were wondering how it fits in the garage, I either let the whip drag along the ceiling, or I open the trunk, which is the easiest way to "tilt-over" this heavy antenna.

From what I have read on this mailing list, it is necessary to have the low-pass filter ground improved before the external grounding will be effective. If the rig oscillates into a dummy load, no amount of external grounding will help.

The way that Yaesu has responded rapidly and professionally has really improved their reputation in my opinion. All work on this equipment was performed for the price of shipping to Yaesu, and the rig was back in my hands within 2 weeks. I only wish that I didn't have to send it in at all! Unfortunately, complex new designs always present such risks. "Trailblazers tend to be hit by the most arrows."

73,
John Shalamskas KJ9U
john@...

Here is a copy of Jeff Sherman's posting that I have lightly edited for typographical/grammatical errors only:

>To: FT100@egroups.com
>Date sent: Thu, 13 Apr 2000 20:50:36 -0000
>From: "Jeff Sherman" <k7xq@...>
>Send reply to: FT100@egroups.com
>Subject: [FT100] RE: FT-100 10 Meter Oscillation problem solved >!!!

Thanks to Erwin on the previous posting on this problem, I was able to identify, locate, and fix the problem. I noticed that the oscillation disappears when the filter board side cover was removed. There should be thick grounding straps added on the ground shell of the J5014 and J5015 connectors to the chassis ground on the LPF Filter board of the radio. The straps need to be as short as possible and as thick as possible (I used 2/16 inch solderwick.) The straps need to be attached right at the "Rib" (the section cavity wall) near the connector shells (ground shell of the plug in connectors.) The radio already had a grounding strap on J5015 but it used a metal strip that was probably too long (too much inductance to ground, a couple of nH's does make a difference!) The copper tape Yaesu used was probably losing contact to the rib, thus losing contact to ground. If the radio is under warranty, it is highly advisable to have Yaesu do this fix, as the circuitry in this radio is extremely delicate and can be damaged easily. I work with RF Circuit Design for a living so I was able to fix it myself.

The transmit section of the radio looks into the LPF filter board before it goes to the antenna outputs. The mini coax connectors that feed these two sections need to be terminated with the proper loads between each section. If the grounding is bad on the filter board side, the transmit section sees a bad SWR which is probably causing the oscillation.

Hope this info helps some.

My FT100 is one of the early production models, which I bought "pre-owned" from another ham. But I think that Yaesu's method of grounding the LP filter is the same in new models. Mobile rigs tend to get a lot of vibration, so using tape to ground something important like this makes me wonder about other engineering decisions... like putting the CW sidetone adjustment on an internal potentiometer!

Topic: 3854 Message: 3854

I was wondering if(actually a friend was wondering)if anyone had used the MFJ 335 BS 5" magnet for mounting the ATAS 100? We put the ATAS 100 on his truck this past week and he is happy as heck with it, but is going on vacation next month and wanted to take the FT 100 and Antenna in the rental car and was looking for an economical mag mout as this is only a once a year or 2 thing. Could the antenna be guyed off with some fairly heavy fishing line as long as it was on the main shaft of the antenna?

From: Dan KN6OL
Topic: 3857 Message: 3857

Rusty,

1st I'd like to welcom you to the list. Perhaps your experiences in solving your specific noise problems will benefit me and many others of this group.

2nd, if you haven't already, I would recommend 2 things:

1) Read the FAQ as posted in the files and links.
2) Read the previous posts in this group.

There has been much discussion in the areas of engine noise as this is the most common FT-100 installation. Good chance what you are experiencing has been seen (or shall I say heard) before, and will have the answers you are looking for.

There are great hams in this group who are happy to help.

Having said all that, what type of noise are you experiencing? In order to get rid of the noise, the 1st thing you MUST do is determine the source. Judging by the fact that you have tried so many different methods of noise filtering, you either have not done this, or there are many sources of your noise. Questions to assist in isolating the noise sources...

1) Is there only one type of noise (Ignition popping, whine, hash, constant pitch, on AM, FM, USB, particular bands, etc.)?
2) Does the noise exsist with the antenna removed?
3) Does the noise change with engine RPM?
4) Does the noise exsist, even for a second, before the engine is started?
5) Does the noise exsist with power controls (mirrors, windows, seats -- although in these cases, they can usually be tollerated)

If the noise is induced (rather radiated) into antenna (goes away when the antenna is unplugged), adding a line filter will do nothing, as the noise isn't entering through the line.

If the noise changes pitch with RPM, then filtering or changing the fuel pump is a waste of time as well, as this type of noise is either ignition noise (popping noise) or alternator whine. Ignition noise can most often be cured with a new set of spark plug wires and a distributer cap (yes, a new one, mine was only 1 year old, and changing them did the trick). If there is a high-freq hash noise at high rpms, then the alternator is often the source of this type of noise, and brushes may simply be bad.

I like to eliminate the noise at the source. If the noise is induced into the antenna, then plugging a long length of coax into the radio, with 1/4 inch of center conductor exposed at the other end, makes a great noise sensor. You can run around the vehicle with this little noise probe and

find the SOURCE of most of your problems. I have found ignition and fuel pump noise this way. Ignition noise can often be grounded out from the radiating source. If the source is the muffler, then grounding the engine block to the hood will probably yield little.

Good luck. Mobile installations are perhaps the most challenging (and most fun). Remember, the 1st radio transmitters were spark gap generators. They used the principle of ignition noise as the transmitter. Today, we loose our hair (unless like me you have none) trying to get rid of the very founding technology that made amateur radio possible :)

Here are a few links that may help in mobile noise. You can find them all on Rod's (www.ac6v.com) web page. Look under the HF Mobile heading.

I have just used these GM parts for direct connection to the battery's side mounted terminals in my 2000 GMC Yukon. They work great. The several part numbers shown in GM's brochure consist of longer than stock battery terminal bolts, spacers to go between the original battery cables and the new cable connectors that come in the "kit", and the "kit" which consists of two battery connectors to which you clamp the power leads from your radio.

Although these are GM parts, my guess is that they would work with any vehicle having a side-terminal battery (assuming you have enough clearance for the longer battery connector bolts).

By the way, you only need ONE of the connector "kits", which contain connectors for both the positive and negative battery terminals.

We can post the part numbers if anyone is interested.

Chris,

Look on FT-100, Micro Mobile Operating Manual, Page 93. Menu Item 50 (CW Pitch) settings of 400/500/600/700/800 Hz with 700Hz being the default.

If you are anything like me, it will be on page 46 tomorrow, and not in the manual at all the next day. I know what it is like to know something is starring you in the face, but the forrest blocks the view of the trees :)

Neil,
The sidetone/beep volume can be adjusted using VR1004 (labeled VR04 on the board). It is located under the top cover adjacent to the speaker connection.
The ATBK-100 is a base station kit designed for allowing the ATAS-100 to be mounted on a balcony handrail. It has all the needed counterpoise/ground plane elements mounted on one side of the antenna, so as not to protrude into the balcony.

3865. ATAS 100 and a MAG mount?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-20 13:40:36 UTC
From: John Walker
Topic: 3854 Message: 3865

A single mag mount wont be enough to support the antenna it will blow over.
Most use a tri or quad mount which are pricey.

73 de N1QXV
John

I was wondering if(actually a friend was wondering)if anyone had used
the MFJ 335 BS 5" magnet for mounting the ATAS 100? We put the
ATAS 100 on his truck this past week and he is happy as heck with it,
but is going on vacation next month and wanted to take the FT 100 and
Antenna in the rental car and was looking for an economical mag mout
as this is only a once a year or 2 thing. Could the antenna be guyed
off with some fairly heavy fishing line as long as it was on the main
shaft of the antenna?

Rusty, although you didn't mention the specific Ford I suspect if it is modern, say post-1996, that it has coil-on-plug ignition without a cap-n-rotor. Sorry to say the niose is radiated through the air, even as far as to the next car over. The good news is, the radio's NB noise blanker is surprisingly effective.

I am informally working with Ford engineering on this. They were under the mistaken impression that the noise does not extend above 30MHz (which doesn't help us anyway) and I showed a field engineer using an instrument worth maybe more than the vehicle it was reading that it goes above 500 MHz.

The list can count on the fact that if and when we find a cure I will mention it!

THANKS SO MUCH FOR THE IDEAS SO FAR. I FAILES TO MENTION THIS IS A
DIESEL TRUCK. HAVE SOME NOISE WHEN SWITCHED ON, BUT CAN TOLERATE IT.
BUT WHEN RUNNING , I HAVE A POPPING NOISE WHICH GETS LOUDER AND
INCREASES IN FREQ., THE MORE FUEL I GIVE IT. HAVE BEEN TOLD THE
INJECTOR MODULE RUNS ON 120 AC (CONVERTER CHANGES 12V DC TO 120 AC)
GOING TO TRY TEST PROBE IDEA TODAY.
ANY OTHER HELP IS APPRECIATED!
THANKS
RUSTY

3871. ATAS100 squeal

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-20 14:35:07 UTC
From: Jim LeFevre
Topic: 3871 Message: 3871

I have recently installed an ATAS100 and am surprised by the "howling" and "squealing" of the mechanism when activated. This only happens at the shortened, or compressed length of the antenna, as it is expanded. I have looked over the post on dissassembly, but wonder if anyone has successfully lubricated this antenna mechanism without a complete dissassembly? Although it is still under warranty, I am the second owner, and if the lube procedure is quick and easy, I'd prefer to do it. Howling is usually associated with friction, maybe water entry. Suggestions?

There is a clutch mechanism in the ATAS-100 that allows the motor to run when the antenna is at its stop. I would not recommend using any lube as it may affect the clutch. I have taken mine apart on several occasions to remove moisture that gets in. I operate mine on a tractor trailer rig and it gets some real abuse from vibration and the elements. I have used RTV to seal all the possible leak places, but still get some moisture if it rains real hard and we are running at speed. The antenna is located behind the sleeper, only place possible, and it gets much wind wiping around the tractor and between it and the trailer. It still works great though.

From: gary
Topic: 3875 Message: 3875

Here is a comment I found on the milcom list regarding the FT100:

==========
And last and worst! I bought the FT-100 Yaesu Amateur Transceiver in
hopes that it's claim to full range Rx. would fit my wanting a good HF &
UHF/VHF rig that would also Tx.
WELL it will display a full range Rx Mil Air (200- 400 say), but it just
does not actually receive anything except a VERY strong sig there. That was
a big dissapointment 8 (
It is a great HF rig, as well as good for 144/440 so I will keep it.
==========

Does anyone on the list use their FT100 for mil air scanning.

3877. RE: [FT100] Texas towers

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-20 19:19:05 UTC
From: Miller, Brett
Topic: 3722 Message: 3877

I find the Texas Towers usually has some of the lowest prices of the major dealers. As a low price leader, you really can't expect the same service level as the guys with the big markups. Even if you a buying a $3000 rig, if the profit margins are thin, service is the first thing to go (there are exceptions, of course).

I don't think it is realistic to expect a discount shop to staff with subject-matter experts. If you want it cheap, do your own research and then call them up and place the order. Don't be surprised when you spend 25 minutes asking questions about which antenna is best, and the guy loses his patience because he is only making $50 profit on the sale. And what about the 9 callers before you that hung up without placing an order? Keep in mind, since Hams are usually eager to help other Hams, the service level at these shops is way above what you would normally experience buying electronics via mail order.

I have purchased many radios from Texas Towers (mail order) and have not had any problems. However, I have never tried to send anything to them for repair/service which is what one person was complaining about.

HRO in Sunnyvale gives you crap and charges retail not to mention tax. The advice you get there is not very good, certainly not as good as the information available on the net. [Serious butt kicking was required for the VX5 users I knew to get HRO to coordinate their returns. Of course, all problems were denied to exist at first.]

Get it cheap because you don't the service that you pay for. One exception to that rule is Javiation over in England. They install options for no labor charge and give good advice.

You are right about the prices that wasn't an issue, it's service and the lack there of.

Some people take care of customers the old fashion way with courtesy and a friendly attitude, not who cares what your problem is today just walk out the door and I'll be fine. Most have the maybe I might be able to help attitude and that leads to increased sales and return business which they are not getting. They did have one ham until 6 months back Cliff, that worked there for years and he was the only corner stone of customer service they had and he took care of the customers all of the time on the phone or in person.

It's part of business if some one returns a product for missing parts or failure
to replace it with in a certain amount of time. After that the buyer should talk with the vendor on warranty. Texas Towers chooses to argue with every one on replacement of defections or missing parts. The attitude is, you bought it to bad call the vendor your self buddy we don't want to be bothered after the sale. They do business on a large scale with the vendors and can replace products and parts quicker than some one waiting weeks to get a replacement or missing part sent out.

John

Well,

I bought my FT 1000MP and my FT 100 from Texas Towers and have
had nothing but GREAT service from them.

And I know folks who live there that like dealing with them.

Guess it's like most any store, you have those who like them
and those who don't!

Hey Guys this is a friendly reminder to keep the focus on the FT-100.
This is not a place to bitch about price and service of various
dealers.

Please lets resolve our focus.

Something for thought...

"Remember Me"

I am the most important person in your business.
I am not dependent on you.
You are dependent on me.

I am not an interruption of your work.
I am the reason for it.

I am doing you a favor when I visit, phone or write.

I am a part of your business,
I am not an outsider.

I am a person with feelings, problems, likes and dislikes
just like you.
I am not just a credit card or money in the till.

I bring my wants and needs to you.
I want you to listen, smile and show that you care.
I want to hear "thank you" when I buy.

I don't want any arguments or excuses, because I always
win in the end anyway.

If I don't get good service, I simply leave.... and tell my friends.

So you see, it's easy;
If you treat me like an individual, I'll treat you like an individual, and I'll come back!

Remember me, I'm your customer.

You are right about the prices that wasn't an issue, it's service and the
lack there of.

Some people take care of customers the old fashion way with courtesy and a
friendly attitude, not who cares what your problem is today just walk out

the door and I'll be fine. Most have the maybe I might be able to help attitude and that leads to increased sales and return business which they are not getting. They did have one ham until 6 months back Cliff, that worked there for years and he was the only corner stone of customer service they had and he took care of the customers all of the time on the phone or in person.

It's part of business if some one returns a product for missing parts or failure
to replace it with in a certain amount of time. After that the buyer should talk with the vendor on warranty. Texas Towers chooses to argue with every one on replacement of defections or missing parts. The attitude is, you bought it to bad call the vendor your self buddy we don't want to be bothered after the sale. They do business on a large scale with the vendors and can replace products and parts quicker than some one waiting weeks to get a replacement or missing part sent out.

I find the Texas Towers usually has some of the lowest prices of the major dealers. As a low price leader, you really can't expect the same service level as the guys with the big markups. Even if you a buying a $3000 rig, if the profit margins are thin, service is the first thing to go (there are exceptions, of course).

I don't think it is realistic to expect a discount shop to staff with subject-matter experts. If you want it cheap, do your own research and then call them up and place the order. Don't be surprised when you spend 25 minutes asking questions about which antenna is best, and the guy loses his patience because he is only making $50 profit on the sale. And what about the 9 callers before you that hung up without placing an order? Keep in mind, since Hams are usually eager to help other Hams, the service level at these shops is way above what you would normally experience buying electronics via mail order.

I have purchased many radios from Texas Towers (mail order) and have not had any problems. However, I have never tried to send anything to them for repair/service which is what one person was complaining about.

Without double checking on the radio...
I believe I run a Mic gain of 40. Eq of 3 for ragchew, 2 for pileup. With compression on, but I can't remember what compression setting (I think 40)

I've never had anything but good audio reports once I turned the mic gain down from the default of 50.

I think my HF SSB mic gain is set to thirty. That gets the best audio quality reports. Don't think something is "wrong" just because your audio isn't sounding good set to 100, or 50 for that matter.

If you are getting good signal reports and good audio reports at 25, enjoy it. BTW, processors always destroy audio "quality" even if they do help add punch. No surprize that yours (and mine) sound "better" with the processor off.

I'm going to echo that 120%. Use what works best for your audio
characteristics. Thats why all these options are adjustable.

3890. Re: [FT100] MOBILE INSTALLATION

Yahoo group: FT100 (1998 — 2000)

From: Dan KN6OL
Topic: 3857 Message: 3890

Rusty,

If disconnecting the antenna removes the noise, then you have certainly ruled out many noise sources (that's a good thing). It is not coming in through the power cables (unless they are radiating the popping noise into the antenna), so line filters will not help. Faster in frequency with increased RPM eliminates the electric fuel pump (at least all fuel pumps that I know of). The popping sound certainly reeks of ignition noise though, so we need to focus in that area.

The noise probe should indicate stronger noise in the ignition wires (spark plug cables, etc). If you are picking up noise with the end of the probe away from the vehicle, then the exposed center lead may be too long. You shouldn't hear anything unless you are actually touching or are very nearly touching the actual noise source (you want to be careful not to touch the hot side of the battery as this may damage the radio). If you are not able to hear any noise with the probe, try either exposing more center conductor or bending it into an L shape. There has to be a length of exposed wire that will yield a result somewhere between no noise at all, and always noise wherever you probe. If you establish this length, then you should be able to detect an increase in the volume/level of noise picked up by the radio as you approach the noise source. You may experience different types and levels of noise by selecting different modes in the radio. For example, AM and SSB may detect different types of noise than FM. I have found that this type of popping noise is best picked up on AM/SSB, but you may find otherwise. Also, insure that the Noise Blanker and all DSP filters are off during this probe mode. I personally found the best length of probe tip, proper mode on the radio, and proper volume of the radio, to be the point where I heard no noise when standing 3 feet away from the vehicle, and a strong signal/noise when touching the spark plug wires or other noise sources. I haven't seen yet a scenario that can't be forced into this set of parameters somehow (although there may be some).

Assuming ignition noise, grounding and replacing wires and caps are the 1st choice. It seems that you have already tried the grounding thing though. Grounding the hood to the block, the chassis to the block, and the block to the frame may help. I have also seen good results grounding the muffler (may need to try various points) to the frame as well, as the muffler is a good antenna. Also, insure that the Antenna itself has good grounding. If not, noise and SWR problems can be seen.

A word about grounding... Use SHORT and FLAT cable, at least 1/2" to 3/4" wide, and not more than 1 foot in length. Braided cable is recommended, and the paint MUST be exposed at the contact points. I use a die grinder and expose bare metal, then use conductive grease and good, strong bolts. I have found that short cutting any of these steps can, and more often than

not does, result in a poor FR grounding connection. Do not use the round battery cables. Most auto parts stores have 1 foot, 3/4 wide braided battery grounding cable with lug holes on each end. They usually run about $6-$10. We are not after a 0 ohm reading here, we are after a good FR ground. A small, round wire will NOT give us this. In fact, using round wire (even thick battery cables) can often INCREASE the radiation, as now we have a nice 1 foot long FR antenna. Whenever anyone asks me what type of wire to ground with, I always say "The wider, flatter, shorter, the better".

Another desperate case I've seen done is actually taking some shielding and wrapping the ignitions wires themselves. I've seen stripping RG-8 cable from its center foam and inserting the spark plug wires through the remaining shielding. Then grounding these cables. I seen small boxes constructed of metal wrapped around the ignition systems itself. Prototypes can be made using tin foil, and copper or foil tape to ground with (nice flat metal tape). The glue on the tape may not conduct well, so keep this in mind. Often, good grounding of the hood and engine compartment can greatly assist in keeping the noise contained to this compartment (although for some reason, not in your case). Use the sniffer probe to insure that the noise isn't coming in on the power lines to the radio. There have been cases where the power lines themselves act as antennas out of the engine compartment, and this RF actually gets induced into the antenna (I am assuming that you attached power directly to the RADIO, and that the power wires are routed far away from any ignition noise sources). Most in line filters don't help this, but swapping out for the external power supply (which you have done) would eliminate this. Any metal objects leaving the engine compartment (A/C tubes, electrical wires, etc.) are candidates for RF antennas.

Good luck. Sorry to ramble on so, I have a passion for mobile installations and the challenges faced with them.

Dan

3891. RE: [FT100] MOBILE INSTALLATION

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-21 02:45:16 UTC
From: gary
Topic: 3857 Message: 3891

I'm sure you mean well, but you forgot his truck is diesel, hence no ignition. The other tips are good. Your emphasis on flat braided cable I assume is to lower the self inductance of the wire, as well as the skin effect increasing resistance. You can also use multiple wires if you have the room and can't find the flat braided cable.

If you go to electronic surplus shops in silicon valley (such as Excess Solutions in San Jose), you can find heavy braided cables that are about two inches wide, with a rubber jacket around it. They are used to shield ribbon cables in automatic test equipment. I've never had to resort to such stuff, but know where to get it if I need it.

Rusty,

The popping sound certainly reeks of ignition noise
though, so we need to focus in that area.

The noise probe should indicate stronger noise in the ignition wires (spark plug cables, etc).

Gary,

Excellent point. Although I have no noise reduction experience with diesels, I should have realized that there isn't an ignition causing this type of interference. Could the fuel injectors be electrical or do they still use mechanical types? The only other thing I can think of electrical in diesel is the alternator / regulator. Unplugging the alternator cable would eliminate that as a source.

Sorry,
Dan

I've only dealt with diesels that are mechanically injected. The Ford web site didn't provide any clues.

Don't try to get any missing parts replaced from them, they want nothing to do with
customer service and friendliness just what do you want today. As if you are bothering
them at home. I've even seen a guy ready to buy a rig and they didn't want to demo it
for them so the person left and bought it mail order, from some one else.

That doesn't make any sense at all to loose a sale on a $600.00 radio because you don't care about the customers questions and are having a bad day.

You are right about the prices that wasn't an issue, it's service and the lack there of.

Some people take care of customers the old fashion way with courtesy and a friendly attitude, not who cares what your problem is today just walk out the door and I'll be fine. Most have the maybe I might be able to help attitude and that leads to increased sales and return business which they are not getting. They did have one ham until 6 months back Cliff, that worked there for years and he was the only corner stone of customer service they had and he took care of the customers all of the time on the phone or in person.

It's part of business if some one returns a product for missing parts or failure
to replace it with in a certain amount of time. After that the buyer should talk with the vendor on warranty. Texas Towers chooses to argue with every one on replacement of defections or missing parts. The attitude is, you bought it to bad call the vendor your self buddy we don't want to be bothered after the sale. They do business on a large scale with the vendors and can replace products and parts quicker than some one waiting weeks to get a replacement or missing part sent out.

Something for thought...

"Remember Me"

I am the most important person in your business.
I am not dependent on you.
You are dependent on me.

I am not an interruption of your work.
I am the reason for it.

I am doing you a favor when I visit, phone or write.

I am a part of your business,
I am not an outsider.

I am a person with feelings, problems, likes and dislikes just like you.
I am not just a credit card or money in the till.

I bring my wants and needs to you.
I want you to listen, smile and show that you care.
I want to hear "thank you" when I buy.

I don't want any arguments or excuses, because I always win in the end anyway.

If I don't get good service, I simply leave.... and tell my friends.

So you see, it's easy;
If you treat me like an individual, I'll treat you like an individual, and I'll come back!

Remember me, I'm your customer.

73's
de Rob

I find the Texas Towers usually has some of the lowest prices of the major dealers. As a low price leader, you really can't expect the same service level as the guys with the big markups. Even if you a buying a $3000 rig, if the profit margins are thin, service is the first thing to go (there are
exceptions, of course).

I don't think it is realistic to expect a discount shop to staff with subject-matter experts. If you want it cheap, do your own research and then
call them up and place the order. Don't be surprised when you spend 25 minutes asking questions about which antenna is best, and the guy loses his
patience because he is only making $50 profit on the sale. And what about the 9 callers before you that hung up without placing an order? Keep in mind, since Hams are usually eager to help other Hams, the service level at
these shops is way above what you would normally experience buying electronics via mail order.

I have purchased many radios from Texas Towers (mail order) and have not
had
any problems. However, I have never tried to send anything to them for
repair/service which is what one person was complaining about.

IMHO, much of this issue is the direct result of the long-standing phenomenon of most hams being the absolutely cheapest people on the face of this planet.....at least when it comes to the hobby (picture half a dozen grown men sleeping on the floor of a motel room in Dayton Ohio.....picture offering $10 for something priced @ $50 and worth $100).

I have NEVER seen anything like it in any other hobby/avocational area (and I am familiar with a few)......

No telling what the continuous carping, whining, wheedling, bargaining, complaining that it was "cheaper at Dayton", etc, etc. it does to people who are in business of selling amateur gear. I think I may not blame them for all of what goes on.

Jeez: Deal with someone you like, who treats you right, and enjoy it. If you can't afford it, stay out of it or operate within your financial limits. As a result of taking that approach, I have no bad stories about yacht dealers.....

Well, my FT100 came back home today and.....it is stable !! During an interim phone call on Monday last I was advised that the fault was not in the PA stages but there was indeed a fault as I had described (good step in the right direction).

The repair details just say "replaced C1349". Bit disappointing really, so simple !

Would anyone happen to know where in the box is C1349 ? I can't find it.

Answers on a post card please.

From: Andrew Walker
Topic: 3907 Message: 3907

I have found it ! On the circuit diagram at least.

Look at the circuit of the Main Unit and C1349 is about one and a half inches west south west of the bottom left corner of IC Q1041.

It appears to be on a TX line and is valued 0.01, 25 volt, B. This TX line leaves the Main Unit on pin 3 of J1017 thence to the Control Unit on pin 18 of J7006. Thereafter is anyone's guess.

Any ideas ? I need a magnifying glass just to read the circuit diagram !!

Best regards to all,

Andrew,
G3OUT

3909. counterpoise

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-22 18:07:10 UTC
From: Ken Brock
Topic: 3909 Message: 3909

Hi Guys:
I have the ft100 and the matching antenna ATAS 100.
I want to use the antenna on the balcony of my apartment.

I ordered the Yeasu ATBK antenna kit with the radials not realizing
that It was designed for a metal railing for counterpoise.
Unfortunatly the railing on my balcony is wood. I have no knowledge
of this subject except that the more mass for ground the better it
would be. Also wonder if aluminum would suffice for a ground plane?

We do have a small metal (steel) table with a sheet metal top about
22 inches in diameter. I would like to cannibalize it (if my wife
doesn't kill me first) by putting the ATBK in the center but hesitate
to do so If It is not enough ground to work.

Any help or suggestions would be appreciated.

Ken,

You can still mount the antenna on the balcony, but use a length of 14 gauge or larger wire along the rail, connected to the ATBK ring. A two foot chunk of metal is pretty much worthless as a counterpoise below 144 MHz. And make sure to warn the family NOT to touch the antenna or wire while you are on the radio, unless they enjoy RF burns.

From the FAQ:

ATBK100 Ground Plane Kit

The ATBK100 is a kit consisting of 3 ground radials for the ATAS100 intended to make it suitable for use as a base antenna. Although there is no information available on the Yaesu website about the ATBK100, this US$90 kit is supposed to supply a ground plane for the 50 Mhz, 144 Mhz, and 430 Mhz bands. One owner responded that he was able to get the antenna to work on other HF bands by adding two 20' lengths of wire to the ATBK100 to act as a counterpoise.

Hey guys,

I send you some amazing info regarding the ongoing fault on the '100 and you all, but one, go quiet !! No mention of grounding, screening, bonding straps, ferrite chokes, odd lengths of coax etc. etc. Just one little capacitor failure !!

Has it all been said before ? Are you all at a loss as to this miraculous cure just by the replacement of this one capacitor ? Or are you still trying to think of something nice to say about Texas Tower ?

Anyone any idea what C1439 is in the box for ?

Andrew.

3913. ATAS 100 STUCK?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-23 11:45:30 UTC
From: kg4fet@aol.com
Topic: 3913 Message: 3913

STORY
Found a problem with my buddies ATAS 100. Gaylord WH2AAT and I put an ATAS 100 on his truck last week and has done great until a couple of days ago. He tuned the antenna and then it became stuck in the down position. He was ready to toss the antenna and the rig into the ST Johns river at this point. He calmed down though after a call to me and to Mark at HRO in Atlanta to find out if he could return it (rig and antenna).
CURE
Do not run the radio without your vehicle running. If the voltage drops to 13 volts or less the radio will begin to lose RX and a small amount off of TX at 13 volts. At 13 volts the ATAS 100 is slow to respond and if volatge drops below 13 its done for, will not move. Keep this in mind when your out there ready to toss the ATAS 100 and your FT 100 in your local body of water, CHECK THE VEHICLE'S VOLTAGE FIRST!!!! or if ya hate them that much send them to me. This also applies to some of you who have complained of deaf FT 100's. At 13 volts you lose almost 2 S on RX and at 12 you lose 4 S.
73 to all and hope to work a bunch on FD with my FT 100 At W4IZ 3A Field Day de KG4FET/AG Sandor

By the way WH2AAT And I invite one and all to join us on 28 390. We are there with a fine group of locals and the more the merrier. Oh and he's keeping the FT 100 and the Antenna

3914. A Question

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-23 13:48:31 UTC
From: Chris Worsley
Topic: 3914 Message: 3914

To the group,

Here is something that has me puzzled.
I have just noticed that when I push the "mode" button to switch from SSB to CW for tuning, (tuning the beam - not the ATAS) the frequency jumps up .70
(xx.xxx.00 to xx.xxx.70)

After tuning, I go through the steps back to SSB, and the freq returns to .00 when I go to AM and FM and finally SSB.

This jump only happens in CW mode. Now my question! Has this been happening all along without my noticing (doubtful) or did I change something when checking menu functions?
I have been searching through the manual, but can't find the answer.

I must tune on a clear freq so as not bother anyone, and with this upward shift it is a little more difficult. (Don't you hate it when someone tunes up on top of you!!!?)

Thanks in advance for any replies.

Chris KD4IBI

I believe this is susposed to do this, always has, just didn't notice (could be wrong though, I seem to remember reading somthing about this offset -- LSB will go down). If you enable the ATAS mode, you can press the TUN button, then press the UP or DOWN button on the front panel. This outputs a small carrier that you can be used for tuning your antenna. You can also use the built-in SWR meter this way too. That's how I tune my other antennas. Doesn't work for 80 or 160m though as ATAS mode doesn't transmit in these bands. I wish I new of a way to override this "feature".

3919. Re: [FT100] A Question

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-23 16:29:09 UTC
From: Michael Jones
Topic: 3915 Message: 3919

The frequency display is showing you the center frequency of your CW tone.
i.e. if you change your sidetone to 800 or 900 then you will also see the
frequency 'change' by that amount. If you hold down the mode key and flip to
CW-R then you will see a corresponding drop in frequency.

On a related note, you will see a similar type of shift in the Data mode for
RTTY.

When you are looking for a clear frequency to tune up, the frequency on the
display is precisely where your carrier is being transmitted.

Ok folks,
There is something missing from this story. The ATAS works and changes directions by the voltage coming from the radio on the coax. It takes about 8.5 volts or less to retract, about 9.5volts or greater to extend. If "stuck" there is a voltage problem from the radio OR it is really mechanically "stuck". Low voltage at the radio will not cause mine to stick. At worst it should only retract!

I dont know if anyone else notices, but when I drive by a big 18 wheeler, I get a TON of garbage coming from it. (Mind you NOT CB garbage).

I have heard about static build up from the tires causing a popping sound. I believe that there is a powder that you inject into your tires that will help eliminate that noise.

3923. Installing in a Chevy Blazer

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-23 16:44:14 UTC
From: Ed Carp
Topic: 3923 Message: 3923

I just switched cars to a 1998 Chevy Blazer, and I'm having a devil of a time trying to figure out where to mount the raio and antenna. Anyone mounted this beast (or any other radio, for that matter) in a Blazer? I'd like to use a through-the-glass 2m/440 antenna, but all the glass is curved - how can I mount the antenna?

TIA :)

3924. Broken Knobs...New Faceplate...NEW FIRMWARE????

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-23 16:49:31 UTC
From: Kent
Topic: 3924 Message: 3924

First of all, I am a new member to this board, and I must say that I am impressed with the information that is available. I have also been enjoying the pictures of the installs out there. Mine will be up soon.

Well, I blew it. The night before the VHF contest, I was tuning up the antennas. I moved one of the them (forgetting the rig was still hooked up), and CRASH, down came the radio, breaking off the Volume and selector knobs (shafts too). I was not a happy camper! Well, I limped along during the contest.....

So the Monday after, I went to AES, to see about repairing it. Turns out that Yaesu also has the complete head for sale ($264.99). So I opted for the new head. Well I **THINK** I see some changes to the firmware on this one. For one, when the ATAS is finished tuning I get the SWR/ANT logo, but WITHOUT the X. To me that means that the SWR is OK. I swear to God that that never came up before. Is this a change?

Now I have another head to play with. Perhaps some day I will replace the Pots. BTW, Anyone know where you can order the parts? Looks like a fairly easy job to do.

3925. Re: [FT100] Installing in a Chevy Blazer

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-23 17:27:08 UTC
From: Michael Jones
Topic: 3925 Message: 3925

On my 97 Blazer I mounted the FT100 under the driver's seat and an FT8100r under the passenger seat. The faces were mounted on a gooseneck to the floorboard. My APRS tracker was also under the drivers seat.

For the FT100 I ran the ATAS-100 to a 4-magnet mag mount in the center of the luggage rack. For the 8100 I used a Larsen round magmount to a Comet SBB5NMO dualbander in the center of the front roof section. For APRS I ran another Larsen round magmount to a Larsen 18" cellular lookalike dualbander. All the coaxes were routed to exit the vehicle in the space between the front door and rear doors. With the coax wedged behind the front of the rear door sill it nover got pinched, crimped, or came loose.

Good Luck,
Mike

Mike,

Thanks! You have hit on it. I guess I just never noticed the change
before when switching modes to CW to tune up.

Also thanks to Dan and Adam.

Hi Kent

Nice pics

Question: How does the ATAS perform in that location as opposed to roof (strong mag) mount??

I currently have a perminent mount on the roof but I am changing from a Safari to a Tahoe

Thanks

3930. Spring for ATAS100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-23 18:35:20 UTC
From: Mark Levine, D.C.
Topic: 3930 Message: 3930

Does anyone know of a company making a spring that could be used between the SO-239 and ATAS100 (or any large VHF/UHF mobile antenna). One smack with a small tree limb has already broken a Comet CQ5M mount and the garage door isn't helping it much either. I'd like to find one for an SO-239, and NMO mount and a smaller spring with allen set screws to place in the middle of a dual-bander.

Any ideas?

3933. Chevy Blazer ATAS mount

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-23 18:46:22 UTC
From: Kent
Topic: 3933 Message: 3933

As I mentioned before, I use a Diamond K400 mount. The nice thing about the way I have it mounted is that I have the screw that allows the antenna to be swung left or right, just loose enough so that I can move it out of the way when I open the window hatch. I have never had any trouble.

I certainly like the ATAS versus changing Ham Sticks!!! Especially in the winter.

I went into the "hidden" menu section of the FT-100
and turning the carrier level down to about 20 watts
and then turning the Mic Gain down to 15. Works okay
on 10 meters.

Hi one & all. Somebody on the list asked where people had mounted their ATAS. I just picked up a Ford F-250 w/a utility body. (Contact W2PW for details & a sales brocher)

The antenna is mounted on the inside of the box about 2' behind the cab. (UHF/VHF on cab roof). The FT-100/ATAS combo works great.

PS Love the F-250 as a super mobil mount.

Press [A] [B] [C] and hold while turning the radio on. Once the
radio comes on release the buttons. Then access the menu section
as you normally would. The "hidden" items will show up at the end
of the regular menu selections 1 - 60.

3941. [FT100] Stuck ATAS100

I have had to return my ATAS100(thankfully under warranty) The tuning motor and coil were all corroded. It seems water can run into the tuning mechanism at the point where the whip enters the rest of the antenna.(the whip could not be removed from the antenna) Be warned

The antenna was never used mobile, only as a "travel" antenna so it never experienced a Canadian winter!!

When I sent in my 9D radio for the SWR fix, it came back acting distinctly
different. Each and every time the ATAS would tune it would finish with the
SWR icon showing which would ijnvariable disappear upon TX. Before the icon
would usually not show as the tuning finished.

BTW some chip was replaced to fix the ARTS CW ID "U" problem. Actually a "W"
problem sounding just like a "U".

Inherited an AD-100 cable for the FT-100. Will this allow the Yaesu desk mike to work with it, or is there a resistor required in the PTT line?

From: David A. Jaffe
Topic: 3946 Message: 3946

Does it fine-tune for lowest SWR on each freq? Or does it just have a single setting for each band? In other words, does it have a limited bandwidth on (say) 40 meters?

The reason I ask is because I don't mind stopping to change bands, but it's really annoying to stop to QSY within a band (e.g. with antennas with a narrow BW and an adjustable top whip.)

It tunes for lowest SWR, but will not re-adjust unless you move off frequence farther than 10kHz. If you have the FT-100 User's manual, these details are in the FT-100 user's manual under ATAS. In mine, it starts on page 62. If during the tune process, the FT-100 determines that the SWR is too far out, the radio goes to RECEIVE mode and retracts the antenna.

Remember, you don't need to retune if you QSY, but the radio will go to low-power during transmit if you QSY far enough that the SWR on the new frequency is too high. If you move, then move back without retuning in between, that's ok too. Depending on the band, you may move quite a bit without affecting the SWR substantially. 17m has a narrow BW, I haven't played too much with the others. It you need to QSY for a quick QSO, and can tollerate the SWR on the new frequency, don't retune. I find that I can move pretty far off on most bands without needing to retune. I think 40m has a pretty narrow BW too. Maybe others have experience in BW testing on the various bands.

I have found that I need to touch the TUNE button to move from CW to SSB. Especially on 40M. It takes about 1 second for the antenna to make the adjustment (within the same band). And I have found that typically I don't need to manually tune the ATAS.

3949. My recent expierence with Yaesu and the FT100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-24 15:59:35 UTC
From: AdamH
Topic: 3949 Message: 3949

During a recent vacation to the east coast I took my FT100 with me for some fun! Radio is a 9F series purchased from HRO in February. Antennas used are a Hustler MO2 with a 10m resonator and a VHF quarter-wave resonant on both VHF and UHF. Both were mounted on the top of the rental Blazer with mag mounts. Power was direct from the battery. About 3 hours into the trip I was just beginning a conversation on 6m when I noticed there was no transmit power out. I checked 10m and same thing. No indication of a problem with SWR ever...power out just disapeared. VHF and UHF were ok. So I hooked up my VX5R and finished the QSO. Good thing I brought it along. On return home, I brought it to HRO for them to send to Yaesu. I dropped it off on June 2nd, Yaesu received it on June 6th and I picked it up from HRO on June 16th. I had about 9 action items on my repair list and they took care of them all as far as I can tell. Some were not repairable because of design flaws but the important ones were taken care of.
Now thats a quick turn around!!!! The parts replaced were the rotary encoder which is the select control, a chip cap,a chip resistor, and a thermal switch. I for one am very happy with the service so far from both Yaesu and HRO-Phoenix. I only hope the radio has no more problems but with all I have read, Im worried.
Radio is back in my pickup and had worked fine so far. Thanks to all on the list for great information sharing and meaningful input. I have found this to be one of the best lists I subscribe to. Adam KF7EZ

It's nice that Yaesu repair is quick, but it's bad that they are getting so much practice. I gather you did not abuse the equipment at all, so why was the repair needed in the first place? What are the design flaws?

I dont know if anyone else notices, but when I drive by a big 18 wheeler, I get a TON of garbage coming from it. (Mind you NOT CB garbage).

I have heard about static build up from the tires causing a popping sound. I believe that there is a powder that you inject into your tires that will help eliminate that noise.

Has anyone notice how noisy the late model Mustangs are coming down the road. I was working field day contacts yesterday between Dallas and Houston and I could hear the hash coming from one hundred yards behind until they passed. It was only projecting from the front of the cars and only the very late model.
I thought that the fact it was 'beaming' forward was a little weird.

3953. FT-100 Receive Audio Problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-25 15:09:45 UTC
From: lee810@aol.com
Topic: 3953 Message: 3953

I am forwarding this message to the list that I got from my friend Jerry, K5OE (k5oe@...) who is in Russia and is having a problem with his FT100. I can't recall anyone mentioning a problem with receive on the FT100 so if anyone has ever seen this and can offer some suggestions (other than returning it to Yaesu) I'm sure Jerry would appreciate it. He is in some remote location in Russia and would like to use it in a contest in July, so returning it to Yaesu for repair wouldn't get it back to him in time (if at all!).

Thanks,

Lee, K0LEE

In a message dated 6/24/00 11:21:18 PM Mountain Daylight Time, K5OE writes:

The claim in VHF is that most noise is vertically polarized, which is why the VHF SSB is horizontally polarized. If HF auto noise its vertically polarized, this may be another reason to go with an isoloop versus a ATAS, though it's not plug and play.

Topic: 3959 Message: 3961

Dan,

You have missed the point. This repair was by Yaesu UK. I did not take it apart. I have no wish to clutter the system and I know a hell of a lot about radio but not this little item. I was hoping for a more intelligent response.

No sense of humour also it would seem. I would think that a person who "don't know anything" would not post anything until he did !!

Sorry you chaps, hoping for some "on topic" input !!!

Andrew

From: AdamH
Topic: 3949 Message: 3962

I can only assume that a factory defect in the part or the possibility that because we have such high temperatures here in Arizona that heat caused the failure, as it does get to 120-130F inside a vehicle during the day. One of the items I complained about were uhf signals leaking thru into the 800 mhz band which were stronger than the displayed frequency.
This is a poor filtering design flaw. But since Yaesu only guarentees amateur coverage, nothing will be done about it. Thats life. Adam

I have a question in connection with the AM operation: in the TX the voice is too deep, there is not any high sound and it cannot be solved by microphone equalizer.
Can it be solved by anything else than the microphone equalizer?

I'm glad you are looking into that part. You probably did not get much of a response because on this side of the pond we are all pretty much dedicated to R133. Perhaps someone will get to the bottom of this situation soon.

I wonder if some of the hams in South America would be willing to investigate an inductor?

May I thank you all for such an overwhelming response to my query, both on this medium and direct !!

Yes I could contact Yaesu and ask them what it is all about but thought it might be a little more fun to raise a new (to me at least) topic on this group. Never mind, I was wrong.

I did not dismantle the radio, I read the circuit diagram. Mine too is under warranty.

I will remain, with true British stiff upper lip resolve, a "SWL" to the group and quietly monitor progress !!

But, before I go, may I say that although the instability has been cured on 12 and 10m, it will still take off with a bad antenna match as you would expect.

Yours listening,

Andrew.

From: John Parkins
Topic: 3969 Message: 3969

Hi all.

Just wondered if anyones FT-100 has initialised itself, with no intervention from the operator? This happened to mine this morning when I switched it on. INITIALISATION appeared on the screen followed by a line of dashes, which went out one by one, then the radio started as usual. Unfortunately it has put itself back to factory settings AND dumped all the memories!

Anyone else suffered this?

JohnGP

3970. SWR PROBLEMS

I have an ATAS 100 which replaced the previous one that got stuck after a day. It has been working ok, except sometimes after I tune it and I get the sign of good tuning, as soon as I key the microphone I get the sign of too high swr. Is this normal and what can I do about it, I have put a longer cable to the antenna, I have chokes on the microphone cable,the speaker and the antenna cable quite a few of them.
Please advice???

I tried calling on 14.240 @ 2315 as mentioned but did not hear any one from Rockwall
Tx. I was on 18.140 for 20mins with stations from AZ and CA and one from OH. That
was all I heard.

The 100 and atas-100 worked great all weekend giving out points on all bands from my
truck.

73 de N1QXV
John

Last evening, I heard people coming in from all over on 20m AND 40m. My ATAS is still in the shop, and I can't match my base antenna for the WARC bands, so I'll just have to listen. We ought to try something in 20 or 40m too. May be surprised!

Has any one had a problem with running a duplexer on 15 & 17 m ??

I can tune the atas no problem with out the duplexer on 15 & 17 but when I have a comet cf530 in line 15 & 17 just runs the antenna up and down and the radio doesn't see a resonate point. Every thing is well grounded and Yaesu and Comet don't have a clue.
Comet did send me another duplexer same model but I still received the same results.

John, Arin:
Keep in mind that some FT-100's have a known problem with HF energy coming back into the raio via the VHF/UHF antenna line and causing problems. These problems do appear as SWR problems. If when you diconnect the VHF/UHF antenna line and the problem either partially or totally goes away, it's this problem that you're dealing with. There is an internal modification that some have had success with. Also, Yaesu will fix the problem for you under warrantee, although some reports are that you may need to specify that you're having this problem for them to fix it.

3977. Re: FT-100 Receive Audio Problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-26 14:20:34 UTC
From: Mike Ketchum
Topic: 3953 Message: 3977

My FT-100 started doing that too just last week. It is annoying the daylights out of me. If I turn it off and then back on again the RX is restored, until I transmit again. It seems to only do it on HF SSB/AM/maybe CW, not confirmed. FM works just fine. I work 10 meters FM with no problems at all. Power output seems to be just fine, a full 100w on FM, and maybe about 110w PEP on SSB. No other problems that I can recall, just the intermitent dissapearing of my receiver. No big deal, hahaha!

The radio is a USA version, 9H.....serial number.

Any help would be great! Any info on how to send the radio into Yaesu would be nice too. I've never had to send a radio in for warranty work before, but expected I would eventually have to when I bought this rig. Warranty work or not, I still think the FT-100 is worth it. Nice radio!

I'm glad you are looking into that part. You probably did not get much of a response because on this side of the pond we are all pretty much dedicated to R133. Perhaps someone will get to the bottom of this situation soon.

I wonder if some of the hams in South America would be willing to investigate an inductor?

Hi Mike

I think a full 100 W on FM is too much . There was nothing in my
manual about
FM on HF but Yaesu recommends 50w for RTTY, so I think its better to use
40..50W
instead of 100W on HF or does it stay cool ?

May I thank you all for such an overwhelming response to my query, both on this medium and direct !!

Yes I could contact Yaesu and ask them what it is all about but thought it might be a little more fun to raise a new (to me at least) topic on this group. Never mind, I was wrong.

I did not dismantle the radio, I read the circuit diagram. Mine too is under warranty.

I will remain, with true British stiff upper lip resolve, a "SWL" to the group and quietly monitor progress !!

But, before I go, may I say that although the instability has been cured on 12 and 10m, it will still take off with a bad antenna match as you would expect.

Yours listening,

Andrew.

Forgive a very stupid question, but:

Have you given any thought to simply calling Yaesu service department on the telphone and asking them about the problem you are experiencing and how to send the radio in for service if you need to?

3982. ATAS on Nissan Xterra?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-26 21:46:18 UTC
From: Chris Barrera
Topic: 3982 Message: 3982

I currently have the ATAS-100 mounted on the hatch of my Nissan Xterra and of course I have to fight the issue of whether I am giving it a good enough ground. Also, I have it mounted so that the bellows are just above the roof of the vehicle.
I haven't yet gone as far as to bond a bazillion panels together. However, I did hit upon one idea:

Does anyone know if the Xterra's luggage rack, which consists of some very thick pipings, would or should by itself make a good ground connection?

Its definitely something to try out, first thing is to find a good way to mount it, my only concern being the overall height of the antenna. The way it is now currently I won't damage anything going into a parking garage (except the whip which is expendable if I make such a silly mistake).

Thoughts?

All,

The HF/50 pigtail on the back of my FT-100 seems to have a break inside of it. When it is wiggled occasionally a GREAT deal of noise enters the radio. Not having much in the way of electronics technician skills myself, does anyone know how easy it would be to repair this? Would this be something best left to Yaesu?

Thanks for any help!

3985. Help! No blank memories!

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-26 22:42:00 UTC
From: Mr. Z
Topic: 3985 Message: 3985

Here's a new one for Yaesu. My FT-100 is 2 weeks old. So, I have
150
memory channels filled up. I find a new frequency that I want to
store into a "blank" memory channel. I press the VFO/MR button to
put
it in the memory mode in order to find a clear memory number. When
turning the select knob, NONE of the "blank" memory channels appear.
It skips over them! I initialized the radio to wipe out all the
memories, loaded them all back in (that took about 30 minutes).
Fine.
Used the radio for about a half an hour and turned it off. Turned it
on today and no blank memory channels. Called Yaesu service. They
said have not encountered this problem. Don't know what it could be.
I said I'll send it in. Jerry said "all we will probably do is
initialize it"! What kind of attitude is that? Initialize this!
Anyone else with this problem? Help!

TNX, CFJ

Here's the full info for Yaesu USA, taken from www.yaesu.com:

Amateur Technical Support (8am-5pm PST)
email: amateurtech@...
voice: (562) 404-2700
fax: (562) 404-4828

Sending the radio to Yaesu is simple. Look up their service department address on the web, and then pack up the rig (with LOTS of padding) and send it in. Include a written description of the problem, so that the technician can duplicate the problem in order to fix it. If you include your phone number they might even call you to discuss the problem.

Calling or emailing the Yaesu service department is a good idea, they may be able to save you from shipping the rig. Email response times have been excellent when I tried it - about 30 minutes when I sent one at lunchtime!

Paul,

You may have played with a setting that caused a reset. For example, if
you look through the country list, it will reset after powering down, even
if you return to the same country that you started with.

It's hidden somewhere in the manual. It's also in the FAQ:

Memory Programming
There are a few common difficulties in programming the memories. The radio has a mode to allow rapid tuning through the memories by skipping unused memory locations. This feature must be disabled to store frequencies in an unused memory location. To disable it, place the rig in memory mode by pressing the VFO/M button until MEM is shown in the display. Then hit the STEP key to enable or disable the vacant memories selection. Reverse the procedure with the same sequence. Turning the SELECT knob will help you to determine if the radio is in rapid mode if you see it is jumping over unused memory locations.

As one of the stations in AZ that John referred to, I also didn't hear any other's come on 18.140. John was running a nice signal from the mobile in Texas into Yuma, AZ.

As I had stated a couple of weeks back maybe another frequency should be tried in the future. The original selection gave too many locations for everyone to be looking. If just one frequency was listed to be looked at maybe more would find the group. Having such a group has merit and if everyone knew where to look you should be able to find the group. I would suggest that with so many having antenna problems on 17 meters and many having beams on 20M it would be easier to hear the mobiles. How about trying the 20M frequency for the next two weeks and see if more can be heard.

You could try and confirm the 'grounding' with an ohmmeter
to the rest of the car. It is hard to find a bare metal
contact to do this test because the automakers coat most
everything well to prevent corrosion.

The rack itself would not be sufficent ground.

Many racks are attached to the car with screws that go into
expanding anchors to get a grip on the sheet metal. These
are often plastic and therefore insulate the rack from the
car chassis.

Not with the ATAS but before my 2000 Outback (with a ATAS) I had a 95 Land Rover and 90 Trooper. Both of those had a nice built in mounting points, the spare tire carrier! You will have to fabricate some sort of stand off. I have pictures on my website of a Halo I had on the LR and if I still had it the ATAS would have mounted in the same place. Just takes some thinking. It also gave me a nice way to route the cables back in (through a grommet in the door hidden by the spare).

Hey guys for those of you who might be interested WH4AAT and I (KG4FET/AG) both FT 100 users in NEFL are on 28.390 nightly until 10:00pm EST or later. We welcome anybody and everybody to check in with us and say HI. Gaylord (WH2AAT/4) is real interested in working some other FT 100 users besides me. Gaylord is an active 1010 member and a VP member as well, me I just work the Wacky Windingers. Also Please join us for the Wacky Wingding net on Monday nights @ 7:30 EST on 28.390(for more info look at www.nofars.org under Wacky Wingdigers or under Gaylords call WH2AAT on QRZ).
73 from a proud FT 100 owner KG4FET/AG Sandor in Jacksonville FL

By the way Field Day update is that the rig was fantastic with over 300 contacts on 6 meters alone, and I might of sold 2 or 3 more for Yaesu, at this rate I need a freebe from Yaesu. For those you who could remember a Call from then I was working under W4IZ 3A NFL

4002. High SWR icon, Yaesu service, and Power Cable

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-28 14:46:23 UTC
From: Ignacy Misztal
Topic: 4002 Message: 4002

When my ft-100 (9E...) is operating with portable but matched antenna (dipole in a hotel, magnetic loop), after a second or 2 of tuning on 17-10m, the high SWR icon shows up. Then, the current drawn by the radio would reset to standby (about 4 A), and the radio would not transmit. This happens with all modes, all power levels, and with ferrite beads in the antenna cable.

I sent the rig to Yaesu earlier this month. The rig would sometimes operate with the loop on 17-10 but only with ferrite beads. My old IC-735 has never had any problems with the loop.

When the power cable is twisted at the radio real hard, the rig starts to operate on 17m. Perhaps the feedback is through the power cable ... Inside the radio, the power cable makes a small loop, and very close to it is another loop that could be part of the 140 or 440 MHz filter.

The radio operates fine with stationary and mobile antennas. But it does not work on 17m and above in portable situation, for which I have bought this rig. Wish 706MK2G cost $950 and not $1300 last December.

Ignacy, NO9E

4003. SWR problems with base setup??

I know that SWR problems seem to dominate the traffic on this list, but I have a question that I have not seen addressed before.

Has anyone that is using the FT-100 as a base unit in their homes with a real outdoor antenna (on the roof, in the trees, etc) seen the SWR problems? Is it always caused by signal getting back into the radio?

Hi,
I had a some what similar problem with high vswr with my FT100. It would show high SWR on known good antennas, including the ATAS. SWR would come and go. The problem was the HPA oscilating at 13Mhz when the radio was at 28Mhz. Yaesu added better grounds to the shell of the coax tieing HPA to filter board. Works great now. It however, took 2 trips to Yaesu and a demo of the 13 Mhz radiating from the antenna.

PS - all the beads and coax length changes will not help if the HPA's are unstable. My ATAS 100 is through the roof mounted/grounded with a Commet cable. Radio is only grounded through the DC cable. It is stable all band in 3 different vehicles.

Once the SWR goes high they bias the HPA's back and you will see the lower DC current your seeing.

Bob,

nice to talk with on Sunday, there has been mention of 14.240 @ 2315 but I haven't
heard any one there. I could be on any 20m freq if some one has a preference other wise 14.240 would be fine by me.

73 de N1QXV
John

As one of the stations in AZ that John referred to, I also didn't hear any other's come on 18.140. John was running a nice signal from the mobile in Texas into Yuma, AZ.

As I had stated a couple of weeks back maybe another frequency should be tried in the future. The original selection gave too many locations for everyone to be looking. If just one frequency was listed to be looked at maybe more would find the group. Having such a group has merit and if everyone knew where to look you should be able to find the group. I would suggest that with so many having antenna problems on 17 meters and many having beams on 20M it would be easier to hear the mobiles. How about trying the 20M frequency for the next two weeks and see if more can be heard.

4007. AS100 problems?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-28 19:06:11 UTC
From: Richard Newton
Topic: 4007 Message: 4007

Hi

I tried out a ATAS100 with my FT100 at the weekend, but had some difficulty.

After setting Menu 61, I found that pressing the TUN button did not cause it to go bold and switch on the ATAS 100 as detailed in the FT100 manual. Pressing and holding would switch the FT100 into tuning mode, but after tuning, the TUN reverted from being bold, thus not allowing any manual tuning. As anyone had similar problems and is this a problem with the ATAS or the FT100 not recognising the ATAS. The FT100 works OK with a FC20 Auto ATU and will switch on/off and the TUN will stay bold when on.

I also found that it would not tune on all the bands, and would seem to hang in either the min are max position - I note the remarks in the book about it resetting itself when not be able to get a match at times.

The ATAS has been returned for now as I was not totally satisfied, but as the FT100 is still under warrantee need to know if that is at fault.

Regards
Richard

I have found that my TUN does not stay bold.

In regards to it getting stuck in the upper or lower position, try manually tuning it...or should I say moving it. All you need to do is get it off of the retracted or extended points, and it **should** start to tune again.

Kent, K9EZ

i have seen the high swr problem on base setup using different antennas
and even a dummy load problem appears on 10, 12 and 6 meter bands
usually in ssb mode but i have saw it on cw as well, doesnt matter what
power level is ran i observed it on the lowest output setting on the
above bands. my cure was to send the unit back to yaesu. its now on its
2nd trip to sunny calif in less than 6 weeks of ownership. i am
expecting to receive it back tomorrow in ups so will test it and let the
group know how it works out. my experience with the change length of
coax or add doughnut coil forget it send it back for a proper repair

Hi, all;

I've decided to sell (her in the UK) my ATAS-100, which has only been used on the vehicle a couple of times. Only reason for sale is that I've found a surplus SGC QMS and whip, which suits the vehicles on which the antenna will be used better.

Please email me privately if you are interested.

From: ad6ez@aol.com
Topic: 4012 Message: 4012

Hi Gang -

Well, it is time for me to send my new FT-100 into Yaesu to fix the CW 500 Hz filter "Popping" problem when I release the key. I have seen several postings that indicated Yaesu made certain mods to untis sent in for other repairs but that you had to specifically ask for them. Could you be kind enough to email me direct with the mods you had done and if they were worth the effort? Once I get them all I will put together a posting with all of the fixes and mods I receive and save others a lot of time gathering this information.

It is bad enough that we have to send our new radios in for repairs before we have a chance to break them in, so it would be great to send it in for as many fixes and mods just this once - I Hope!!!!

Tnx to all on this list for all the great info and help!

Regarding the muted audio and full-scale ALC meter reading phenomenon, here is Chip's preliminary response. I suggeted a temporary fix of taking off the cover and putting a fan on it and he reponded that might not be a bad idea. I'll send the rig in for repair when I get home in late July or early August.
73,
Jerry,
R3/K5OE

(from Yaesu tech support)....
I can only give a "best guess," but it unfortunately sounds like there is some sort of a heat sensitivity in op-amp Q1062, which is on the Main Unit(it's a type NJM2904V-TE1, a real small guy). If it is consuming too much current for whatever reason, it may be dragging down the -9V line, and that would be consistent with the symptoms you describe.

That IC is by the edge of the board--if you can locate it, you might want to stick a finger on it to see if it's too hot or something.

I'll see if I can come up with any alternative ideas. Don't know how to get you a replacement IC, if in fact that is the problem.

4014. R: [FT100] SWR problems with base setup??

Yahoo group: FT100 (1998 — 2000)
Date: 2000-06-29 07:11:37 UTC
From: Fantini David
Topic: 4014 Message: 4014

I've been reading to the list for a long time, and I've never experienced any of the problems that are filling my mailbox. I'm sure that probably I've been lucky since july 1999 but, I think, that's due to the usual base station work of that rig. It stays for 90% of it's power on time side by side with my old FT307, connected to a perfectly tuned Butternut HF6V mounted on the roof of the 5 storeys building where I live, fed thru 5 or 6 meters of RG213. Only for 17 and 12 meters operations, I have to insert an MFJ 969c tuner in the feeding line. When at seaside, I used also a fishing rod with direct feeding on 20m and tuner on other bands. Occasionally I use with the same results (no SWR icon, within the <=2:1 SWR range) a Comet CA-HV on single magnet base on the top of my car (parked in the backyard of my holiday home).
Now, I hope that my lucky experience with FT100 won't arouse envy and curses.... because I would continue enjoying my FT100 in the short time that I can spend in front of the radio and, above all, because I wouldn't try the service efficiency of the italian Yaesu representative....

Denny,

Some of the others will probably mention the oscillating and high SWR problems, etc. The mod I wanted to suggest is the one for proper AM transmit audio. A couple of rigs here have had this problem. Problem is the transmit audio is distorted and cannot be ajusted properly. I think the fix is an adjustment in the bias (I'm not sure of this.)

Brett & all other listeners!

Brett asked, "I know that SWR problems seem to dominate the traffic on this list, but I
have a question that I have not seen addressed before.

Has anyone that is using the FT-100 as a base unit in their homes with a real outdoor antenna (on the roof, in the trees, etc) seen the SWR problems?
Is it always caused by signal getting back into the radio?"

I'm a fairly new FT100 user. Been already to Yaesu to be fixed. Entire PA board plus other parts. After about a month that is! Anyway, I run mine base only for now (and after hearing all the stories about ATLAS I will look for a different manufacturer!). I use a GAP Challenger DX for HF and a Cushcraft AR270B VHF/UHF. No duplexers. SWR on the GAP on all bands is excellent. I did a quick check last night and the only band where the SWR is higher is on 6 meters. Depending on where I'm at on 6 meters, it appears that the tuner tries to tune while I'm transmitting. That seems strange.

Never have seen a high SWR icon and don't know what it looks like. I switched the meter reading to show SWR bars and usually only see 1 on all bands, maybe 2 once in a while. Except for 6 meters as noted above. There the bars must be about 8. I run the FT100 into the Yaesu tuner FC20.

I'm keeping my fingers crossed that Yaesu fixed it right. They said they did a bunch of updates when it went in for repairs.

Bye the way, this group idea is great! Love hearing all the interesting happenings with the rig and accessories. Great ideas spread around the world! It would be nice if someone (like Yaesu) would capture all of the tricks with the rig and provided them on their web site in some formated arrangement.

Keep the faith FT100 users. I'm a Kenwood user for the past 20 years so going Yaesu was hard to do. I will try hard to put the rig through the paces and see if it holds up.

Could someone gather up the mods and fixes current for the Yaesu FT-100 and post them to the group. I need to send my radio in but I dont know the "grocery list" of fixes and mods that I could get done while it is out there.
I got my radio in early september and had the opertunity to use it on field day with great sucess, but only used it as a 40 meter station.

Thank You

Norm, your radio is normal. If you get the mod to work, let me know. I have a friend who tried it and it does not work for him. Nobody on this list wants to admit to having done the mod and so it's hard to get any specific details. The published procedure seems a bit ambiguous and so I'm very interested to hear of your success or otherwise. I'm standing by to do the mod on my own radio as soon as somebody tells me that it definitely works. Good luck.

Taking the top cover off and putting a desk fan on the rig "fixed"
the problem for now. With the top off and no fan, the problem re-
appears--so it is definitely heat-related. At least I can still use
it for the IARU HF test next weekend.

4027. Using TUN button w/o ATAS or FC-20?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-01 15:17:00 UTC
From: martyt@pobox.com
Topic: 4027 Message: 4027

Just bought a new FT-100 and plan to use it with a High Sierra screwdriver antenna.

Wondering if anyone has figured out a way to make the TUN button put out a carrier (at reduced power?) for the purposes of providing a signal to tune against on the screwdriver antenna??

I tried setting the TUNER/ATAS menu (#61) to "tuner" but nothing happens when I press the TUN button - presumably because there's nothing plugged into the BAND DATA pigtail cable. But, looking at the pinouts for the cable, I would almost bet that TX INH has something to do with it..

Anyone know what the sequence of signals that goes between the ATAS (or FC-20) and the FT-100 looks like? There's got to be a signal to initiate tuning, and at least two that come back from the tuner - one to say it's done and another to say it ain't happening (high SWR).

Barring the above, what does the group recommend as the best way to get a signal on the air for tuning an antenna other than the ATAS?

-Marty NW0L

The mods on the internet are not quite the same as the official
yaesu mod, If you provide your dealer with a copy of your
MARS license you will get a copy of the yaesu mod, which
will not void your warrenty. If you do the mod you will lose
the ARTS and SCH functions, and perhaps others yet unknown.

It needs to be stressed, better than the manual does, that for proper AM the RF must be brought down to approx 20-30% and the Mic Gain also down to approx 20%. I can't imagine why the rig doesn't do this automatically.

Oh? In what way are they different?

My name is Pres, and I have done the mod. (tip o' the head to Bill W.)

I didn't notice that the "Internet mod" killed ARTS but I haven't really tried it.
But what is SCH? If it is the band scope that definately DOES work.

And if the "Internet mod" is some sort of bootleg I would be surprised because there
is no way someone stumbled acrosss those wacky frequencies to enter.

Set rig to AM MODE
Go to menus and set HF TX to 10
Whenever you want to tune the antenna with just a carrier, put the rig in
AM and key the mike.

Worked for me with an LDG-10

Mike,

In my manual, page 83 - Menu item #50 sets the CW sidetone pitch. Hold FUNC key to get Menu setting mode. Turn Select knob to #50 and set by turning Main Dial. Then press FUNC key momentarily to set and exit.

Years ago I was responsible for getting service for the Motorola FM ht 's used by our company. Without fail If you could describe the problem accurately the tech's knew what part to replace and if they were not busy could usually do the repair is just a few minutes. Most failures of this type were related to a component that had some kind of weakness and the tech's saw the same problems repeatedly. By now the tech's at Yaesu have probable seen all of the problems that can happen to a FT-100 and can trouble shoot the problem from half way around the world with no problem. They just don't want you to know what the weakness are because everyone would start putting pressure on the manufacture to upgrade the parts or fix the problem before it failed. My FT -100 was DOA out of the box due to TX failure ! I really think that the unit had been returned to the vendor and when I purchased it at Dayton last year the vendor saw a chance to get the radio out of there stock by shipping it out to me since I refused to pay the OH state sale tax. They sent me a defective radio and I wound up haveing to ship it to CA. saving the vendor the cost of shipping and repairing the radio. The vendor claimed that Yaesu would reinverse my shipping cost but I never saw a penny of my shipping cost. Need less to say I can't prove any of this but you can bet that vendor will never get another cent out of me and I stopped my brother form making a purchase from them at the Shelby NC ham fest last year. He had to send his FT-100 back for audio failure and my radio has very low audio out even with the volume at max. and a Clear Speech DSP connected to a 8" speaker ..... Don't get me wrong I love my FT-100 and think it is vastly superior to the original 706 but I think we have to face the facts that Yaesu knows that the radio has problems and they sure are not going to tell us what they are.

He is looking for the level of the sidetone, which means the loudness. I would like to know the same thing.

From: John Shalamskas
Topic: 4038 Message: 4043

Here's something culled from a recent posting on this list.
Thanks to Neil Sablatzky <wa2wim@...> for sharing this
useful info with us!

The sidetone/beep volume can be adjusted using VR1004 (labeled VR04
on the board). It is located under the top cover adjacent to the
speaker connection. The ATBK-100 is a base station kit designed
for allowing the ATAS-100 to be mounted on a balcony handrail.
It has all the needed counterpoise/ground plane elements mounted
on one side of the antenna, so as not to protrude into the balcony.
Best Regards, Mike Krueger - N6MIK, Yaesu Technical Support

4045. water bottles on ATAS

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-03 04:50:55 UTC
From: gary
Topic: 4045 Message: 4045

I noticed a few of the ATAS's installations I saw at the local flea market today had water bottles on them as a means of shielding them from rain. They just the bottom of the bottle (plastic of course) and slip it over the gasket of the ATAS. Anyway, those with leaky ATAS's might want to hack with this idea.

Some hams have said that the hole the stainless steel whip is inserted
into goes straight through the top of the antenna and will let water into
the ATAS mechanism.

In my experience, this is not true. The socket for the whip is only a
centemeter or two deep and obviously can not let water into the ATAS.

Has anyone else verified that some ATAS DO have a hole that is bored all
the way through the top cap piece?

4048. CW Sidetone Volume Level

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-03 16:57:33 UTC
From: Bob Evans
Topic: 4048 Message: 4048

The CW sidetone volume(not PITCH) can be adjusted by removing the rig's cover that has the speaker. Next to the speaker's connector on the circuit board is a tiny potentiometer labeled VR04 (VR1004). Turn the pot clockwise to increase the volume. I had to turn mine almost 180 degrees. I would suggest getting the proper "diddlestick" tool because this pot is REALLY tiny and you can break it if you're normally heavy-handed. I used a combination of an erasure on a pencil and a knife tip, but I think I was lucky not to break it. Did I tell you it was TINY?

I didn't find this info in the Yaesu manual; I remembered reading it in the original June 1999 QST evaluation article. QST had to increase the CW level as well.

I use my FT-100/ATAS-100 for mobile CW and they are performing quite well! I'm having a ball with them.

Just for the record:
Had two bad ATAS100's returned for not tuning.
The one I have now has worked perfectly for the last year
through rain storms, snow and 70+ MPH speeds.
Yaesu replaced the antennas through HRO quickly and without question.
NO problems with the FT100 from day one!
All was purchsed May of 99.
I'm a happy camper with this set up on my Pathfinder spare tire rack. (The
antenna that is.) and the radio under my front seat with the control head on
my stering colum.
So far so good!

4052. Low processor efficiency

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-05 14:57:47 UTC
From: Ignacy Misztal
Topic: 4052 Message: 4052

I tested the SSB signal of FT-100 and TS-850 on the air. With FT-100 initially transmitting, audio quality was reported as good. After changing to TS-850, signal quality was described as much improved (from tinny to balanced), and with processor on in both rigs, 2S better in TS-850. Listening to FT-100 on TS-850, I noticed some distortions in peaks as if there was some oscillation during peaks of transmission. Increasing processor level over 60 in FT-100 deteriorated the signal quality with little increase of strength. That was at all power levels and with many combinations of audio settings. I know that TS-850 has a better RF processor but would expect only 1S and not 2S difference. Comparing mobile rigs on the air, DX-70 usually sounds great, IC-706 is OK, but FT-100 only average. Has anybody played with audio settings on the FT-100 and compared its signal to other rigs? Any clues why the processor is mediocre at best? Could it be that some stages are overdriven and produce too much distortions?

Ignacy,
Do yourself a favor and try the DSP mic Equalizer. The Processor in the FT-100 does not respond to my voice very well either, however if I use the DSP EQ setting on 3 and leave the mic gain at 50% I have recieved nothing but excellent audio reports on SSB. I have worked pileups on both ends (busting and on the rx end of them) with these settings with nothing more then a G5RV and the rig. Try all of your options before you slam the rig for lousy audio. The mic on the FT-100 may just respond to your voice different then the mic on the TS-850. Just food for thought from a happy as heck FT-100 user.
73 de KG4FET Sandor always on 28.390 or 7.251 when the FT 100 is on at the home QTH

Do you really expect good performance on 800mhz with a pl-259 connector?
On uhf and vhf you should be using N type connectors.
Cut that pigtail connector and replace it with a N type
and then try 800 mhz. Also you need a good coax for 800.
the vx-5r does not have all that loss to deal with
Good luck 73's

I seriously doubt the connector will make that much difference. Out of band reception is always a bit shaky on ham equipment. Cable loss is more likely. Note that the PL-259 is often referred to as a UHF connector, though the intent is more like 400Mhz versus 800 Mhz.

Not really.

I have installed hundreds of VHF and UHF radios that had
PL 259 connectors. GE, Motorola and others.

But we always used GOOD coax, not RG58!

The handbook, what can I say, other than the N connector is far
superior to the pl-259 for 2m and up, note: the ft-847 uses a N connector
for the 440 ant connection, the pl-259 is great up to 30mhz. Go to
N hearing is believing, most new cars come with a donut spare,
that does not mean that it's the best.

Dear Howard,
I, too, have experienced the poor non-existant 800 MHz
reception. With my Ft-100 you have to be below the tower just to hear
it! I was told the FT-100 will not receive the 800 band-even though ads
say it will. The ad was never replaced. My FT-5R also received poorly
so I sold that one. I keep the Ft-100 as a good mobile.
Jack

The "loss" though an N-connector compared to an SO-239 is about half a dB.

Since the smallest change in audio that the human ear can detect is one
dB, hearing is NOT believing. You can not hear a half a dB difference.

Regardless, I converted all my equipment that is at 2M and above to N
Connectors. Those one-half dB gains at the rig, both amplifier
connectors, and the antenna DO add up - and that you CAN hear.

Actually, the situation is much better than 0.5db loss or even 1db as you are not losing audio level at all. Rather, it is 1dB of RF, which is made up by the AGC. Since FM goes through a limiting process, you are not losing any audio. If the signal is very weak, you will loose "quieting' in the receiver. In the case of the FT100, it probably is dead at 800mhz. You are really better off just adding a wide band scanner. Use the right tool for the job.

Now bad connectors and transmitting is another story. Small losses can still mean lots of reflected energy, which is hazardous to the transmitter PA.

Last Time I checked a person that could detect a 3db change in audio had above average hearing of coarse this all depends on frequency. But that is a different topic all together.

In regards to RF I was under the understanding that a 3 db loss equaled a 50 % power loss. So lets see .5 db at the PL259 X 2 connectors Plus 2 db feed line loss into a ? wave unity gain whip and wow that 25 watt UHF rig is now only putting out 12.5 watts ERP. I would think that keeping the losses to Minimum should be very important when dealing with UHF.

Best Regards and 73?s

well i can tell you about losses. I put a repeater online, and thought untill i can get some better cable i will use some belden RG-8x. Boy, this repeater is on 447.125 Mhz, The losses in the two three foot jumpers between the repeater and cans was huge, and i had a 6 foot peice between the cans and the antenna. It had a range of 1.5 miles with 20 watt repeater and a 20 watt moble. I replaced it with some LMR-240, same diamiter as RG-8x but half the loss at UHF, same lengths and everything. Now this repeater has a range of 10 to 12 miles to mobles.

I tried a piece of belden RG-8x on 2 meters, boy that was a mistake also. a 50 foot piece had 50 watts going in and 13 watts comming out. Do the math RG-8x is a dummy load for 2 meters and aint much better for 6 meters.

Just my 2 cents worth.

Like I said, transmitting is a different story. I believe a connector loss is really due to SWR, while a cable loss is energy dissipated in the cable. While both are not good, the SWR related loss reflects power back to the PA, which is not a good idea if you want to keep your PA cool.

Receiver losses should be made up in the AGC. Ever talk simplex on FM and have your QSO partner change the power? Fifty watts sounds like 5 watts if you are getting full quieting. That's the beauty of FM.

Trying DSP equalizers was the first step. My voise is best at 2. I also tried carrier adjust. The summary is this: FT-100 gets great signal reports at its best settings. But, after switching to TS-850, reports say much better signal and 2 S louder. The test has been repeated many times on the air, with identical outcome.

Come on guys!

First point.
Is FT100 a good receiver on 800Mhz?
What´s the sensitivity?? If´s vy poor thats the reson why it´s so hard to rx signals.
If the sensitivity is ok then look for bad connectors, feedlines, antennas and so on.

But we need to know if FT100 is a good RX on 800MHZ first. For what i understand that was the topic
at the beginning

Hi Jerry:

Just got my FT100 back from Cerritos and just like Chip had predicted, they changed an IC called NJM2904V-TE1 and now my receive performance is back to normal. So you have that to look forward to when you return from Russia. I will leave Chip's comments attached below for those who may have missed them. The whole process took less than 1 week, including the July 4th holiday.

Barry - W4TGA

I cannot believe my eyes , reading all these ridiculous responses about a pl259. All that I had asked about was if everyone experienced the very poor sensitivity characteristics at 800 mhz that I had. I never hoped to read such poor , untechnical responses . Incidently , my ft100 came with an N connector and for your info the fade margin on a uhf signal in real time is greater than .5 db especially when listening to mobile stations so this garbage about an N vs 259 is nonsense at least on receive and or transmit with low power where heating is not an issue . I never said that I was doing EME with my ft100 . I did however receive one intelligent response , probably from someone who has been licensed for more than 10 minutes . Good Night and thank you anyway . In the spirit of ham radio I hope that you all don't spend your life on the internet , but instead build and experiment . That's what this hobby was founded on ! Keep up the faith and GN from Canada.

Howard

4080. "Error Icon" Question

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-08 04:14:50 UTC
From: Tom Forrest
Topic: 4080 Message: 4080

Hello Friends...

I just install the FT100 in my 99 Ford Ranger truck. Antenna is a Hustler monobander(20 meter band for this) on the left bumper. I gounded heavily and radio works great. Made some nice DX contacts! I have encountered the "Error" icon, but yet I still get output. I've checked the antenna with the MFJ analyzer and SWR is 1.2:1 on the 20 meter band where this seems to show up the worst. Can anyone explain or give me any ide of what's going on. The radio worked great for about a week and I've changed nothing in the set-up.

I did cure the problem by adding a 18" jumer in the line. The problem has not come back in the last few minutes, but I'm going to try it like this for a few days and see what happens. I check it again with the MFJ Analyzer and checks out OK.

Any help or suggestions would be helpful.

Thanks,
Tom, N4GVK

Do not despair Howard !

Here in the UK, 800mHz + or - is used for terrestrial TV.

Using a 70cm vertical on this frequency and my FT100, I found numerous video, sound channels and some S9+ video. Non, I might add from my local TV mast so they were at least 40 miles away.

Is this any help ?

For the record my N connector is through an adaptor to 259, unknown feeder but low loss UHF "type" and a single vertical collinear !!!!

73's, Andrew,
G3OUT

4082. Airband-Sensivity

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-08 11:19:06 UTC
From: Lorenz Grassl
Topic: 4082 Message: 4082

A friendly hello from South Germany!

I´m Lenz, DL8RDL, reading this mailinglist since one and a half year. My question is concerning the sensivity of the airband-frequency range.

I had a Standard C-5608E before and its sensivity in that qrg-range was really great. Now, the FT100 is really DEAF in that range. Is there any possibility to increase the sensivity or is the reason simply: "It´s amateur-radio-gear and adjusted for amateur-bands such as 2m, 70cm..."?

But I say: the C5608E was amateur-radio-gear as well... Probably not the best?

Greetings: Lenz, DL8RDL

4084. Fan Vibration

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-08 20:18:50 UTC
From: Nelson Moyer
Topic: 4084 Message: 4084

I bought an FT-100 in Feb. 2000 and I've noticed a strong continuous pulsing vibration whenever the fans are on, which is most of the time, since they come on whenever you transmit and stay on for at least 10 sec. I suspect that one or both of the fan motors or blades are unbalanced, and perhaps interacting. The vibration is much worse when the radio is sitting on a hard surface, like a desk, but it's noticable when I hold the radio in both hands up off the desk. I'm worried about premature component failure from the vibration and I'm wondering if other FT-100s suffer from this curse. AES service hasn't noticed a problem and told me to contact Yaesu service, which I have done, but no response in over a week. Meanwhile, I'm interested in reports from other users.

This adaptor isn't made by Yaesu, so you won't be able to find it
from them.

It is made by Heil. It is called the Heil AD-100-8. I guess most of
the ham radio dealers should have this (Ham Radio Outlet has
them).

I've sent a message to Yaesu about a week ago asking them if
there was an adaptor for using the MD-100A8X desk mic with the
FT-100 and they told me about this adaptor.

Nelson -

My FT-100 does vibrate a little when one or two fnas ore running. When it is hot - one runs all the time. But I wouldn't say it is excessive. You may have a problem with one of those fans.

I find that incredible.

Ft-100's sold in Australia all have N type connector on the vhf/uhf pigtail.

Are you guys trying to tell me that your radios do not?

I would be writing to Yaesu and asking the obvious question if I were you.

Serial number here is 9DO22161

4088. Dynamic mic interface

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-09 12:18:14 UTC
From: Gary Mitchelson
Topic: 4088 Message: 4088

I beleive a good part of marginal TX audio is due to the poor mic. Since my Heils work so well on my base radios I wanted to make a Heil hand mic. The stock FT-100 mic only has 3 pinholes to let voice waves through and that is not enough so I am looking for a better case.

I am looking for info on what is needed to run a dynamic mic into the FT-100. Bob Heil has the AD-100-8 but I want to put the circuit into the mic case as not to have all the dongles hanging around. Anyone know what this circuit is?

From: Lorenz Grassl
Topic: 4089 Message: 4089

Hi, FT100-Users!

Today´s question want´s an answer about the handling of the IFS/Clar. knob.
As you know: pressing the button once shortly, you can adjust the RIT.
Pressing the button a bit longer, you can adjust the IFS.

Now the problem: If you adjust the IFS and you´d like to go back for
adjusting the RIT (pressing the button once shortly while in
IFS-setting-mode) - the IFS is centered again and you can set the RIT.
Is this a bug and corrected now? Or does only MY FT100 act like you read
above? By the way: I purchased my FT100 in August 1999

Thanks and bye!!

Lenz, DL8RDL

I need a some info on what type of Duplexer or Diplexer that I need for my FT-100 so I can run 6m 2m and 440 mhz all into a single mobile antenna? I've got the antenna and I'm using an MFJ switch right now but this is getting old. I really like the performance of the radio so far. Bought it at Ham Com last month. Thanks in advance.

If you want to run a 6m/2m/70cm mobile antenna and feed the 2m/70cm
part into the VHF/UHF pigtail and JUST the 6m side into the HF/6m
pigtail, then you can use either the Comet CF-530 or Diamond MX62M
duplexer. These two duplexers have one input for a 6m/2m/70cm
antenna and have two outputs, one is for 6m and one for 2m/70cm.

If you want to feed the HF/6m pigtail with the output of one of the two
above duplexers AND with an HF antenna, then you'll also need the
Comet CF-360 duplexer (I don't see a Diamond version). This duplexer
has two inputs, one for HF and the other for 6m, and one output to go
to the FT-100's HF/6m pigtail.

So if you want to hook up just the 6m/2m/70cm antenna, then all you need
is either the Comet CF-530 or Diamond MX62M duplexer. If you also want to
hook up an HF antenna, then you'll also need the Comet CF-360 duplexer.

Nope, fans are clean and no bumps. I've used the radio in the shack: no mobile operation yet. It had the pulse vibration right out of the box.

I say you guys, is that a bit strong for a family web site ?

I know you are a bit short on patience out there in the wilds of North America coz you always get what you want when you want it !!

Take it SLOWLY.

You will feel so much better.

AW

Sorry to hear of your FT-100 problems. Have had mine since January and have had NO problems. Mark me as a very happy owner. Please do not take this as an accusation, but I would be looking very carefully at my installation, etc., if I had multiple failures. Good luck with the repairs.

Rich, K6BFO

My FT-100 and ATAS-100 have been flawless ever since I had Yaesu solder a short, fat ground lead onto the low-pass filter module. It is also very important to have low-impedance ground connections at both the rig and the ATAS. The Comet trunk lip mount is NOT a sufficient ground without some modification. If you look at their 3/8 inch threaded mount, it has the ground lead attached to the top half of the mount, so it bypasses the various crap at the bottom of the mount.

In my case, I happened to have the ATBK kit, so I just used the metal doughnut without radials and screwed a nice fat copper braid into it, and ran the other end to the car body.

Well, my opinion, pal, is that you lose in the long run by not being able to enjoy a great little radio.

Think about how many 'complaints' you have read on this reflector and how many people own the radio.

I'll bet for every 'complaint' expressed on this reflector about the FT-100, there are better than a 100 units out there working just fine thank you very much (mine is one of them). There's a silent majority out there that doesn't need to say anything about their radio...because it works and they are enjoying it.

Someone once commented that most of the the people who are on the (put product ID here) reflectors have an ax to grind about the equipment, are having problems with it and/or are seeking a solution to a problem, or are there to exchange operating hints/kinks about it.

Most of those people with the radios that are working just fine don't need the FT-100 reflector.

(Why am I here? I wonder sometimes, but I have learned some interesting things about the radio that was not described in the manual, so it does have some value and keeps me reading.)

Years ago, I had this aching desire to get a computer (this was way back when: pre-Apple II). I kept putting it off and putting it off waiting for the computers to level off and stop getting better every other week. But, after a year or so of watching others with their computers (albeit, somewhat behind the 'state-of-the-art' by then), I finally jumped in and bought a computer. Six months after I bought it, it was replaced and the support to it was dropped within another year or so. BUT, I got to play with the computer, learn from it, and enjoy it...even if it was becoming more of a boat anchor with every passing day. Moral: Don't wait! Do it now and be done with it.

For home units, you can put up with a few trips to the factory. When you do an auto install, it is a PITA and you don't want to screw with it more that once. You know the drill, laying on your back in some uncomfortable positions wiring something up. When I installed my last radio, I had to crawl into the trunk.

4107. Description for fix to stop PA 14MHz oscillating on 10M

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-10 08:29:59 UTC
From: Darren Rainer
Topic: 4107 Message: 4107

Hi all, my FT100 is fine all but I cant use 28MHz SSB or 29MHz FM using the ATAS 100 in the car.
Has anyone got any details on exactly where to connect a short braid to the chassis.
I know the PA is oscillating at 13/14MHz when I go and tune on 28/29MHz.
Apart from this
problem I am very pleased with the radio.
I know its under warrenty but I would like to fix the radio myself if I can rather than send it away.
My ATAS100 and ft100 are well earthed to the car body. I have tried large ferrite rings on the coax and all the leads.
Also I have tried different lengths of coax. It looks like the only fix is to do the pa stage mod.
Has Yaesu produced any details on what to do ?
Regards

Darren Rainer G4VTQ Burgess Hill, Sussex, UK

4108. Results of Yaesu service

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-10 16:04:24 UTC
From: Ignacy Misztal
Topic: 4108 Message: 4108

I have sent my FT-100 to Yaesu. The rig came back with many extra soldered components. Below is a list of inital problems and how they were fixed.

1. Fans were very noisy like out of balance for the first minute of transmitting. On return, the fans were quiet for the first 3 weeks then started making the same noise again.

2. High SWR Icon showed on 17-10m with single-mount mobile antenna and with magnetic loop and indoor antennas despite low SWR and current baluns. There were no problems with 3-magnet mount hamsticks or base antennas. On return, the problems is less but not eliminated. The grunding wires of filter cables have not been reinforced.

3. Mediocre voice quality with distortion on voice peaks. On return, the distortion has disappeared, the differences between different equalizers is much smaller than previously, and with processor out, the equalizer does not appear to make too much difference. Anyway, the signal quality appears to be much improved.

One question to anybody who has answers. Is power setup specific to each mode? In my case, power set in FM affects power set in SSB. I would like to set low power for one mode so that tuning at low power can be accomplished with one button rather than going to menus.

Ignacy, NO9E

Hi Darren,
You have the same problem my FT had. The fix that they put in was to gnd. the conector shells of the coax tieing the HPA board (both HF and VHF/UHF)to the filter board, at the filter board. The gnd straps were about 0.2 inches wide and tied the coax shells on the filter board to the casting center web. It fix'd the problem. No ammount of varying coax cable lengths etc will. My system runs the ATAS in the center of the roof with a through the roof connector on any of 3 different vehicles. The systems only RF gnd is at the antenna base. There is no RF on the cables and the system is now stable all freq, all bands.

I've had my FT-100 and atas-100 for over a year now with absolutely no problems. My installation is in the files section for my Chevy Tahoe. I haven't done any special grounding(mount uses Teflon coax). I have had the hi-swr maybe two or three times I have put it back to 50mhz and let it recycle fully retracted and went back to the band I was working. I think sometimes it slides by. If I can hear the station I can usually work them, if the pile-up isn't real bad. Nobody has said anything about low audio, in fact they have said it was a "good signal"

I have had very good luck and great audio reports. Even though i am long winded and run the rig at full power on FM and it gets real hot, it has continue to work with no gliches. One thing i have found after a long QSO on 2 meters or 70 cm it is best to tune down to HF or 6 meters and let the fans run on low speed to completely cool it.

PS. the duty cycle may not be 100% but i bet i have used it in 50 to 60% service with long winded conversations both on 6 meters with 100 watts and 2 meters and 70 cm at full power.

The book reccomends you hook it up to one of the bracket mounting
screws. I have it grounded there between the rig and the bracket
right to the aluminum chasis.

From: D
Topic: 4115 Message: 4115

Ok, I had to jump in and say something here about syntax. If you don't really care, just delete this.

The acrynom for cycles per second is named after some cool electronic dude named Hertz, and the abbreviation for him is Hz (capitalize H when using Hz). The metric for mega is capital M. Lower case "m" is milli. Not only does mhz not mean Hz, but it means milli hertz (which would actually be seconds per cycle).

Having rambled on about that, Mega-Hertz is stated in the IEEE standards documents as MHz.

Actually it would be 1.2Ah, since the A is for Monsieur Ampere. Note that Hertz is universally capitalized, but some engineering conventions use lower case for AC and upper case for DC, in spite of V standing for Volta and A for Ampere.

4118. Bad audio reports when vehicle is moving ?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-12 14:37:59 UTC
From: Darren Rainer
Topic: 4118 Message: 4118

Hi all. any ideas on this problem. My FT100 is installed with a boom microphone a homemade switch box. The audio reports I receive on FM and SSB are good when the car is staionary with the engine running (even when its reved). Yet when the car is moving I get reports of distortion. The gain is not to high as I have set it just above the level of the supplied mic. I have inductors and caps for filtering the DC (9V) supplied by the FT100 and pF caps down to gnd from the audio line itself.
Anyone sucessfully fitted a mobile boom mic ?
Regards
Darren Rainer G4VTQ

PS Thanks to all who helped with the oscillation problems when using 28/29MHz. The cure was to fit a second strap from the VHF/UHF TX coax lead down to the chassis. I now can use 10M without the bad SWR icon appearing.

Jeff

My FT-100 works great since I found that I had not solidly connected the HF ground coax in my original installation. I was seeing the so-called "high SWR icon" problem and poor automatic tuning response. Most of the problems I see mentioned on this reflector are probably installation deficiencies or lack of understanding the product rather than rig/antenna problems. People are used to half way doing an installation (including me...I was just so darn excited to get it up and running quickly) and that won't fly in a mobile installation with a smaller than usual antenna (ATAS-100).

Don't send it back without checking, or having someone else check, your installation.

Well, then how do you explain the mods that Yaesu is doing to radios that they are sent by customers, even to the new "D" model.

I have the AD-100 cable from Heil.

1. Am thinking of the HM-10-5 mic. Does the mic have the gain necessary to drive the FT-100?

2. The handmike from the FT-1000MP will work in VOX only with the adapter line (no PTT function). Normal?

3. When using a Yaesu Dynamic desk mic in VOX as above, there is not very much drive, even when the menu is set to full (100). Normal?

4. Is the "not so good" audio response from the handmike caused by the small size holes for the mike? Anyone changed them?

Thanks for taking the time to answer.

Topic: 4123 Message: 4123

Just made a few menu settings on my FT-100 to change the TX audio around.

Using the stock hand mic:

#25 to 40
#64 to -.150
F25 to 140

I did this while in 75 meter QSO with a fellow I talk to every night. The above settings gave what he called, "Nearly as good as you sound on the 1000MP."

I also note that the TX output power is now on a parallel with that of the 1000MP.

I'm open to comments and recomendation about these settings. Am I over doing something?

NOTE: The F25 setting is only for 75 meters.

On number 4, which mic? the one that came with the radio?

I have heard several people complaine about the stock mic on the FT-100, but i have had great audio reports from my stock mic. i have the SSB audio set to 30 and it works great. The compression i have at 20, and it really gives it punch with out the distorsion that many report.

"not so good audio" What are your settings? and do you have the dsp mic equalizer on or off? Sounds like you might have a setting too high.

Bob:
I agree with you that people should check their installations very carefully before sending a radio back for repair and I do suspect that some of the high SWR problems reported are installation or antenna related. However, some FT-100's do have a known problem with sensitivity to HF signals coming back in the VHF/UHF port on the radio that results in erratic transmissions and a high SWR indication. I've verified this on an installation in my truck, confirmed this with a Yaesu rep at Dayton, and finally got around to sending the radio back to be fixed today. I put my other FT-100 in the truck and it does the same thing, so it will go back when the first one returns. So, while normally I'd say that most high SWR problems are installation or antenna related, there are certainly a number of such problems with FT-100's that aren't. BTW, I think this problem is corrected in the FT-100D.

Hi Bob, if you don't want to send it back, the fix for the high SWR is simply putting a piece of copper tape between two points inside the radio. It took me about 10 minutes do do in my lunch hour at work.
I got the details off of this list. If your worried about affecting warrenty its easy to take it off again.

4127. RE: [FT100] Audio

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-13 07:32:21 UTC
From: William Mastop
Topic: 4122 Message: 4127

Bill, when we are speaking of "not so good" audio, what is being referred to? The level of voice, or the quality of the voice? On mine, I consistently receive very good reports about he voice quality, but am often told that my voice tends to sound louder than everyone else's. This is with gain and such set at the factory default.
I wonder if the mike is particularly sensitive to some voice frequencies, and not to others? During field day recently, I had opportunity to use a number of other rigs, as well as the FT100. It was noticed that my voice tended to have create greater drive on the FT100 than it did on two other rigs, and that others voices would have a much better result on the other two rigs than did mine. This test was of course unscientific, in that we were not measuring the decibel level of the various voices, but it does make me wonder if perhaps the various mikes tend to have a different response to different tonal qualities in voices.
William

sorry to disagree with you but a friend of mine just purchased a ft100d
and lo and behold the high swr icon problem. i dont buy the hf sigs
getting into the vhf port as when my ft100 was having the problem we
attempted connecting 1. vhf antenna to the pigtail 2. a dummy load
3.installing a shorted pl259 on the vhf pigtail result zippo. my 10,12
and 6 meter problems were present no matter what antenna was hooked up
to the pigtail in fact with a dummy load on we once detected two
oscillations one at 13.9999 mhz and one at 74.325 mhz. bottom line. if
you have the vswr problem dont screw around sent the rig in for a real
fix.after two trips mine works great

4129. FT-100: Pactor and Packet Radio performance (9k6)

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-13 12:35:41 UTC
From: Christian Buenger
Topic: 4129 Message: 4129

Hello ...

I am planning to buy a FT-100. I am currently using an ICOM 706. I am happy with it, but it has not 70cm included, which is necessary for packet radio. I mainly use my 706 on portable or /mm activities. But now I am thinking of buying a FT-100.

- How is the PACTOR performance? Has anyone tested it with the PTC-II? Is it possible to remote control the frequency (like with the IC 706)?

- How is Packet performance? I am especiallly interested in the 9k6 FSK mode? Has anyone looked at the transmitted signal? Is it a "good" FSK signal? TX-delay seems to be ok... IIRC

- Has anyone used it with a longwire (abt. 25m)? Is intermodulation a big problem? Is is possible to solve it easily (e.g. turning off the pre-amp) or is it necessary to use a pre-selector?

- Is there anything _really_ important I have to know about the transceiver before buying it? Any flaws?

Thanks in advance

Can't help on the Pactor, but....

The pre amp can be turned off for all bands except 2M and 440. It is fairly easy to do.

Antenna.. I have used a hunk of wire (40'?) into a tuner (MFJ cheaply) without any trouble.

Hope this helps!

Kent, K9EZ

PS - I LOVE the radio!

Ken:
My guess is that in some cases there is either enough couping inside the radio to cause the problem or there are other problems (perhaps a bad connection to the pigtail or it's connector). There is however a known problem as I described that Yaesu acknowledges. The reason I found this out was that I have VHF/UHF power amps and preamps connected to the VHF/UHF port on the FT-100 in my truck. When I first did the installation I didn't have the controls for the preamps, so they were permanently powered on. When I installed the controls for the preamps and turned them off I suddently started having problems on HF. It took me a while to figure out what had happened because I did a number of things that day, but the net result was that when the preamps are off the relays switch the antenna straight through, passing everything. With them on, they only pass signals within their bandpass. Since I have an HF whip with an SGC tuner on one back corner of the truck and a 2 Meter collinear on the other corner and a UHF collinear nearby, the amount of signal I was getting back in with the preamps off was significant. The radio should however have been able to deal with it and I've never seen that kind of a problem in many similar installations before. The nice Yaesu people at Dayton confirmed this problem and we discussed at length what they were doing about it. One thing he stressed is that they do more than simply putting a ground strap inside the radio to fix the problem and reccomended that it be sent in for an update.
Normally I'd be scheptical as you are about such a problem report, which is why I kept going back to verify what I saw happening. Unfortunately in this case we have to accept that this is a problem with some FT-100's (perhaps all of the earlier ones) even though in many cases people aren't seeing the effects due to the nature of their installation.

Kent:
I'm assuming that to be the case until told otherwise. Clearly this is a warrantee situation and they should. Since Yaesu has never let me down on support, I don't expect that to happen this time. All I did was to send it in with a letter describing the problem and requesting that it be fixed.

The fact that someone got a bad "D" rev is disturbing. You can attribute bad units being shipped to old dealer stock. Nobody should have OLD FT100D's, so the need for Yaesu to tweak the FT100D means there is a QA problem at the factory. If there is a fix that is done on a return basis, it should be incorporated in the factory design.

hmm... sounds good... And no serious intermod problems? But you guys in
America don't have the intermod problems we have in Europe ;)

This is why it is so nice to have all the menu adjustments available on the new rigs. The biggest problem I have encountered, however, is finding good listeners that can realy help on the receiving end while you are tinkering with the adjustments.

Intermod...
I have HEARD some intermod on 2M when I have been downtown in a big city.
Have not tried on 440. And again... the pre-amp is ALWAYS on for 2m and
440. You cannot turn it off.

From: Nelson Moyer
Topic: 4122 Message: 4140

I've used a Heil ProSet with HC-4 element on the FT-100. I got some bad audio reports with the mic gain at 50 (default) on 15 and 6 meters. Turning the mic gain down below 40 seemed to help. I haven't gotten anyone to listen to me while I adjust for optimal audio, but need to do that, as the FT-100 dosen't like to be over-driven. I can't address the other issues.

4141. DC-passing duplexer for FT-100 and ATAS-100?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-13 23:54:20 UTC
From: bruce@perens.com
Topic: 4141 Message: 4141

I want to use the ATAS-100 for HF and VHF under normal operation. I know about the performance deficit on HF. What I need is a duplexer that passes the ATAS DC motor power. Does anyone know of specific models that provide DC continuity?

Thanks

Bruce K6BP

From: Alek Petkovic
Topic: 4122 Message: 4146

That's strange, I've had to increase the gain from 30 (standard Yaesu mic) up to 75 when I use the HC-4.

To get those settings, I reduced mic gain whilst speaking and noted the output on a pep reading meter (Autek WM-1) until the output dropped. I then turned it up a few points to maintain max output. The 30 and 75 settings arrived at by this method corresponded to the best on air audio reports as well.

I agree on your overdriven point. I think the default etting of 50 with the standard mic is to strong.

73 de Alek,
VK6APK.

From: W4TGA
Topic: 4147 Message: 4147

Hi all:

Just returned from an 800+ mile road trip with the repaired FT100. It worked as advertised. No more fading receiver performance after 3-5 minutes of operation.

Heard lots of stations, worked a few and really enjoyed the rig. Even had a ground wave contact on 17 with a fellow Yaesu owner headed the other way on I-85. We were in Georgia and a fellow in Oklahoma broke in to report he was monitoring us 20/9.

I'm headed to the West in about 10 days for a 5000+ mile trip and hope to have the pleasure of many contacts enroute.

Thanks to Yaesu for the quick analysis, fix and turn around.

73,
Barry Kanne

Darren, the FT 100 uses a separate ground for the microphone. It is best not to connect it to your regular ground. If you do you can get alternator whine on your transmit signal.
Also I found it beneficial to keep the headphone ground isolated as well.

4151. Other Mics or Heil

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-14 06:13:32 UTC
From: Denis Coolican
Topic: 4122 Message: 4151

Bill, I use the HM type of mic in my setup. The level is lower than the ft100 mic but with the gain at 70% there is full modulation. Remember that the FT 100 has a separate mic ground and it does not like to be attached to chassis ground.

I will be trying out the Heil mike in operation on a motorcycle.

4152. RE: [FT100] Other Mics or Heil

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-14 15:29:51 UTC
From: Darren Rainer
Topic: 4122 Message: 4152

Hi Denis, thanks for reply. Looking at the pin out of the microphone
connector in the manual it only showed 1 gnd connection.
If there is a seperate ground as you say that could be the problem. I wired
up my boom mike as per the circuit that was posted on the board. I am trying
a few ideas out this weekend. One idea is to use a 9V battery instead of the
9V from the radio. I'll let you know if I have any sucess.
73s
Darren G4VTQ

Subject: [FT100] Other Mics or Heil

Darren, the FT 100 uses a separate ground for the microphone. It is best
not to
connect it to your regular ground. If you do you can get alternator whine on
your
transmit signal.
Also I found it beneficial to keep the headphone ground isolated as well.

4154. The difference between RX and TX freq

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-14 17:50:17 UTC
From: Mihályi Attila
Topic: 4154 Message: 4154

Hi,
On my FT100 the RX freq deviates from TX freq with 200 Hz in SSB mode.
This difference is particularly annoying in digital modes.
How can I bring the TX and RX freqs to the same level?
Please reply. Thanks.

73,dx

4155. ft-100 hf failure

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-14 20:39:04 UTC
From: Don DeCaria
Topic: 4155 Message: 4155

All,
Guess it was my turn...have a 9E model I bought in May 1999...worked great for 13 months, including a couple of cross country mobile trips...
Last month, 3 hours out on a 3 week cross country trip, my hf power output went south as I went west.
All other functions OK on hf/6, including good receive. VHF/UHF OK.
Getting very weak power out on hf, all modes, confirmed by outboard receiver and fact that ATAS-100 was getting enough power to tune itself.
No previous problems with rig, although I did fix the high SWR icon with shielding about 5 months ago, and did self-install the filters and did the wideband mod about a year ago with only minimal difficulty.
Previously I had used the diplexor and the ATAS-100 for all bands, this time I was using a separate VHF/UHF antenna. V/UHF antenna was magmount in middle of trunk lid, ATAS was on Diamond trunk lip mount on edge of trunk lid...'98 camry. I mention this because I thought maybe I had pumped too much power into the hf section from the vhf/uhf antenna being too close to the hf antenna...but receive was fb, and only the "P.A." seemed affected...unlikely symptoms for that...concurred with by the Yaesu tech.
At first opportunity, which was Utah from MD by way of MI, I sent the rig in for repair after calling Cerritos. Very courteous and helpful. Bad news being my rig was one month past warranty. They did say that they would fix the rig and perform all outstanding mods and expected turnaround time would be 2-3 weeks.
Returned the other day to MD from the trip, and had a msg on the machine that the rig was ready...BTW I did ask for the install of the TXCO module, replaceing the three broken ribbon connectors I had "fat thumbed" and broken the retaining clips on when I installed the filters, and asked them to look at an intermittent "af out" jack on the back that I think may have had a broken solder joint that I had temporarily repaired. Total bill of about 125 dollars, which included the tech time charge of $50.00 per hour. Dealings with yeasu have been courteous and very good.
I guess if I were a better wheeler dealer I coulded have whined hard enough and maybe gotten the warranty extended?, but then again I pay too much at car dealers, too, so what can I say...(Vic, this smile is for you! :-)
Bottom line, rig should be back this weekend, better than new. I will report what mods were done if I can find them documented, and try to wring it out in the car in the next couple of months so I can (re)develop my confidence in the rig before I make my big move to Southern Nevada in October in conjunction with retiring from the Navy

and getting a real job after almost 32 years as a squid!
Only thing I can think of to change is move the VHF/UHF antenna farther away (to the middle of the roof) and keeping the ATAS where it is on the edge of the trunk lid. I'm not sure the way I had it was a problem, and as stated before, neither did the tech, but it can't hurt to move the antenna there at any rate.
Given that the installation had proven successful in the previous year, and the rig had no insurmountable problems in the previous year, I can only conclude it was a random failure of the radio and not anything I did (antenna placement notwithstanding), but I am open to suggestions. I have done all the usual choking, grounding, counterpoising, bonding, etc., and am confident that was not the problem.
I did drive through a good thunderstorm, during which I disconnected the antennas earlier in the drive, but DID make successful 6 meter contacts about 30 minutes later, so I don't think that was it, either.
Still love the radio and can't wait to get it back, but it is going to have to earn my confidence over again during the next several months, and I must admit it took all my "grown-up" that I had to not let the failure really put a damper on what was a great trip that could have been even better had the radio been operational.
Hope this info is of interest as we compare our experiences with this radio that we all are trying very hard to get to live up to our expectations!
73 and thanks for reading this if you got this far...
Don

Don,
Sorry to hear about the HF power problem at the beginning of your trip.

I don't know if this might have been feasible for you, but....

Had it been me facing a 3-week cross country trip, my next stop in some big city with a big ham store (and if one wasn't on my route, I would have made it so) would have netted me a new radio on my card. Once home, I'd sell the radio (or the one just back from factory service)for a couple hundred less than what I bought it for and joila! Got my trip with radio, got my radio fixed, and got most of my money back. I'd call it "rental". Compared with other costs (gas, lodging, food, entrance fees to whatever, etc.), it's cheap 'rental.'

Hope your's keeps working.

Gary,

No explanation needed. From your comments, I'm encouraged that Yaesu would update my unit automatically with any changes, if I ever had to send it back for repair. I may have to break the rig myself, just to get the updates, because it just keeps ticking along with no problems at all.

Also, since the FT-100s are now so cheap ($950 at the Dallas Hamcom) after the "D" came out, I'm buying another one for home use!

From: Tim AD6OP (G4WIM)
Topic: 4158 Message: 4158

I've been reading the various threads about fixes for the Hi VSWR / tx instability problem. My FT-100 also suffered from this problem even though the antenna (ATAS-100) was over 100 feet away and well grounded. The VHF ant was about 50 ft away from the rig and HF ant.

Interestingly mine was a late model FT-100 and had had the internal ground strap mod done at the factory - but the ground strap was soldered to a piece of sticky copper tape which was not a DC ground and would have been of limited effectiveness at low freqs.

I removed the sticky copper tape and replaced it with a small solder tag which goes round the screw which holds the cover in place, adjacent to where the tape was. Thus I had a real good ground and no further problems. (The tag is so thin it does not impact the fit of the cover).

This may explain why the mod doesn't always work and why some FT-100D's are still suffering. Especially as the rig gets quite warm and could cause the glue on the sticky tape to loose adhesion.

I haven't had a problem with the "High SWR" icon yet. Where would I
look in the radio to see if this ground strap was installed in my radio???

That's not nessesary... just mail it in a few weeks before the warranty
expires. I did that with my FT-847 and the FT-100. Both came back with a
tune up and all the latest updates.

I think you would have had to pay for the speaker as this was not a mod but introduced in the FT-100D they told me at Dayton that it would be a while before they had the speakers in stock to sell to FT-100 owners.

Now I'm confused (or more confused that normal). I thought the FT100 has no problems that can't be fixed given a return to Yaesu.

I'll say it again: If Yaesu knows what to fix on these radios, why are they shipping FT100D's that need mods.

From: Charles Scott
Topic: 4058 Message: 4176

All:
I checked out the 800-900 MHz performance of a receint FT-100 (not a "D") while I had it on my bench. While not what I would call "nonexistant", the performance above 800 MHz was not great. It ranged from a sensitivity of a few uv at 800 MHz to about 10uv at close to 950. Considering the other losses involved with a normal installation and antennas, signals would have to be reasonably strong to be heard.
Mine also has PL-259's.

In an attempt to clarify with regards to the Yaesu mod for this instability / hi swr problem.

IMHO the mod Yaesu performs is inadequate and as a result doesn't always fix the problem - hence why some sets are returned more than once. Further I'm not convinced it is a long term fix.

I consider the use of a square inch or so of sticky copper tape to be woefully inadequate means of providing a low impedance path to ground. It doesn't even stick too well to the die cast metal !

After all they use a fairly substantial ground strap to make connection and then use a poor (sometimes open circuit DC path) means of providing the actual ground connection. Even when it is successful, how long will the glue hold the patch in place ?

I consider a proper ground tag far superior and shouldn't be beyond the abilities of most radio hams to install.

BTW I didn't return my rig to Yaesu for modification because I thought I could do the mod myself (and better), further I didn't want the hassle or be off the air.

In any event, so far so good !

Good luck to all of you who feel compelled to return your rigs for this particular modification - over time it'll be interesting to see how things work out.

Topic: 4178 Message: 4178

Help!

Can any one post some pictures in the files area or send me some of a neat installation in an Ford Expedition? I just bought a 2000 and my wife will do great hrm to me if this isn't neat and nice looking.

Thanks,

Lewis KM5BH

In the product literature I recall seeing a little asterisk which led me to some text stating 'specifications are not guaranteed outside of ham bands.'

I always tell people who want to receive stuff out of the ham bands, "Go buy a scanner if you want a scanner. It will have more memories, scan faster, and be more sensitive. And you won't accidentally jam anyone."

4180. RE: Hi SWR modification

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-16 22:10:08 UTC
From: emoxon@alum.mit.edu
Topic: 4158 Message: 4180

Hi Tim.
My 9E was in Cerritos in Oct '99, and now has two straps, as others have described here on the list. To answer Mike's question -- there are a couple of photos in the ft100 file area, posted by Bob, W8CBR.
www.egroups.com/files/FT100/FT100+Inside/ft100topside1.JPG and ft100topside2.JPG
The straps are visible if you know what you're looking for. They are soldered to the outside of the shells of the coax connectors on the LPF board, then run to pieces copper tape formed around the middle rib of the casting, and soldered there. The connector reference designators are J5014 and J5015. The tape is identifiable in these photos, and the straps are the shiny things that you can follow back to the connectors. The length is on the order of an inch or so. In April I described here how one piece of tape had pulled away where it was stiffened by solder and reluctant to conform. My response was to use springy paper clamps to really pinch the tape to the rib -- it looked kinda tough to get a screw thru the rib itself. Your use of the cover screw has even more of a positive feel to it. So do we think the factory would now be doing two straps? And I guess we conclude that tape is the factory fix as well as the field fix.

4181. Re: SWR Mod?..(Where)?...

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-16 22:12:53 UTC
From: Stephen Mitchell
Topic: 4172 Message: 4181

I've been on vacation for over a week and have missed a lot
of the discussions here. Maybe someone can advise me
what this SWR mod is. My FT-100 recently came back
from Yaesu after the 6KHz AM receive filter took a dump.
While the radio was there the Techs did all the upgrades
to the radio (that included removing the copper strip from
J5015 to GND and replacing it with a piece of aluminum).
The radio works pretty good... contacts with some VKs,
JAs, IAs, and one GM while mobile (all on 20 meters with
the ATAS-100) here in San Diego.

Anyway, I've never been able to obtain a good match on
6 meters and I occasionally get a high SWR icon when
using certain bands even though the ATAS-100 loaded
up fine with only 1 to 2 bars showing on the SWR meter.
I've tried adding 3 ft. of coax as suggested by Yaesu and
other members of this group with marginal success, I've
also placed a ferrite choke on the HF coax near the radio,
and one on the speaker lead. I've also grounded the radio
to the body of the truck which is then grounded to the frame
of the vehicle in several places.

Can anyone offer a possible solution that I've overlooking?

I peered inside my FT-100 and noticed that mine has one more strap that
either isn't installed on the radio in the pictures provided by the above link,
or they just aren't visible. My radio has a strap going from the aluminum
shield (just above the three vertical mounted boards left and below center
of the picture) that also go to the copper tape that is on the chassis rib.

If they are using copper tape with aluminum, the connection will eventually corrode. Use a magnet and see if the metal in question is really aluminum.

4184. FT-100 quality of fixes

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-17 12:12:21 UTC
From: Ignacy Misztal
Topic: 4184 Message: 4184

I mentioned in my mail that the FT-100 signal was scratchy, and that the trip to Yaesu has seemed to fix that. That was with tests on 10m. Talking on 20m yesterday, the scratch was there. No sure whether that was due to unstable final or RF feedback. The antenna was a quad about 30 ft above the shack, and there are ferrite beads to eliminate radiation from the cable. The radio has strong distortion if one talks too close to teh microphone; current settings are mic gain at 50 and processor at 60. Also, the speech processor does not seem to be very effective. Has anyone compared the FT-100 signal with any other radio?
Ignacy, NO9E

4186. AM TX quality fix

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-17 14:20:56 UTC
From: Gary Mitchelson
Topic: 4184 Message: 4186

I have been playing around with my FT-100 and trying to do something with the stock poor 6M AM TX quality (6Khz filter).
I think I have stumbled on a way for much better quality. I put a sample of an off-air recording on my website and would be interested in comments if anyone else can duplicate this. The file is about 1.3MB to preserve the audio quality. http://n3jpu.tripod.com/Mobile.html

The main fix was to adjust menu F51 AM Carrier Level from the default of 119 to 225. I also set the RF PO out to 25 and mic gain to about 50.

I turned the AM carrier level DOWN so that the carrier was around
25 watts and then turned the Mic Gain down to 15 and have had no
complaints.

4190. HISWR solution?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-17 17:25:31 UTC
From: nrg@radiolink.net
Topic: 4190 Message: 4190

I have checked on my FT100e, I have only a strap from the connector J5014 (v/u tx) and nothing on the J5015 (hf tx).
I would like to add this second strap by my self.

My question is :
I would like to know if somebody did this connection with simple copper wire from the connector J5015 and straight to the rib of the casting with good result ?

For the moment my FT100 work without HISWR problem, because I left an cross needles SWRmeter connected between the antenna and rtx !!!??? I would prefer a more professional manner for solving this "HISWR bug"
HI

Thank for helping me in this work

I did look at the waveform on the audio analyzer in the 'scope mode and originally 2/3 of the wavform was below the 0, now it is uniform. Also on the Icom 756 band scope 2/3 of the energy was on one side of the carrier, now it is uniform.

4194. RE: [FT100] HISWR solution?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-18 07:47:21 UTC
From: Darren Rainer
Topic: 4194 Message: 4194

Hi Ferdy , yes my radio had a strap already fitted in my radio on the HF connector J5015 but to stop the 13/14MHz oscliiation when using 28MHz I found by fitting a piece of copper tape from the V/U TX connector to the nearest point on the chassis completely cured the problem. I used copper tape with sticky on one side. This soldered to the connector ok but the adhesive did not stick to well to the chassis. I fixed a piece of plastic between the pcb and the tape on the chassis to keep it in place. This seemed to work well. The radio is now 100% fixed and I have no Hi SWR icon appearing anymore.
There are alot of people on this list saying the tape ius no good at RF. Quite simply it has completely cured the problem on
my installation and it will not work loose the way I have secured it.The fix only took 5 minutes to do. Other people are sending there rig back to Yaesu but its worth trying to do it yourself as its easy to remove if necessary.
My setup is FT100 on remote cable in a Ford Probe car. ATAS100 on back wing of car with Diamond boot mount and braided earth
strap to car body and boot lid. Length of coax 2M to rig fixed in the boot. Perfect match on all bands 40M to 6M.
Separate dual band antenna for 2M and 70cm on magmount.

Subject: [FT100] HISWR solution?

I have checked on my FT100e, I have only a strap from the connector J5014 (v/u tx) and nothing on the J5015 (hf tx).
I would like to add this second strap by my self.

My question is :
I would like to know if somebody did this connection with simple copper wire from the connector J5015 and straight to the rib of the casting with good result ?

For the moment my FT100 work without HISWR problem, because I left an cross needles SWRmeter connected between the antenna and rtx !!!??? I would prefer a more professional manner for solving this "HISWR bug"
HI

Thank for helping me in this work

Hi Tim

I am using it all the time. Works UFB.. Did an own construction of th
e powerkit though. Using a modifed WILSON 6ft CB antenna or a
longwire. for HF use and a MFJ tuner. 10-30 ft of wire as
counterpoise
will work most of the time.You should concider that lead-acid are not
well suited if you planning running hi-power use NICD if possible
instead. For 6M i use either a longwire or a HB9CV. for 2m and 70 cm
i
use HB9CV specially made for to use as little space as possible when
not in use..

4196. Hi SWR icon fixed

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-18 12:09:08 UTC
From: Ignacy Misztal
Topic: 4196 Message: 4196

With a compact loop antenna, my FT-100 showed HI SWR icon with fixed setting on 17m. Put frequency counter next to it, and as mentioned many times, the frequency was around 13.2. The connector in the middle of the filter closest to the RF board already had a grounding strap. The one next to it did not have any grounding, even to the board. I grounded it temporarily with a screwdriver, and the oscillations stopped. Then, I used a piece of desoldering tape to connect the two connectors, and the radio seemed to be unconditionally stable. Took 1 minute to do. When the radio was at Yaesu for service, they added all kinds of toroids and perhaps more. Hard to believe that they did not do this simple fix! Thanks to information from this group, my radio is finally useable as a portable rig on 17-10.

From: Tom Forrest
Topic: 4197 Message: 4197

I get an "error" symbol in the left corner of screen (where the HI SWR symbol is) Can anyone explain just what it's trying to tell me. I do have very good SWR and by adding an 18" jumper in the feedline at the radio the error goes away goes away. It happens on some of the bands but not all. The manual mentions it, but I can't find what it really represents. Any suggestions would be greatly appreciated!

Tom,

the only time I've seen this was when I had a bad condition with my coax it was crimped
some where. You did not mention what your setup is, atas-100 for one antenna or what.
It means some thing is severely wrong or out of wack.

John N1QXV

I've had my FT100 since Nov 99 and I love it. The only probably is a noisey fan the first time I key up the transmitter. Antennas, I have an Odessey Van and a Z mount (home made) connected to the frame. I tried a Hamstick, and because it is 6" from the Van I can't tune it, not even with the FC20 (sold it bought an LDG used only in the house). What I have found the works great is the Spider Antenna. I have it on a large RS spring and a quick disconnect. I'm also guying it to the roof rack with some small nylon twine (this may not be necessary, but at 80mph???). I have no trouble working the world with
my 100w and Spider. I haven't heard anyone else say they were using the Spider. Maybe all the good stuff is being keep a secret. Jerry

Jerry,
Good feedback on antennas. I'm in installation process now with a Hamstick on my daughters Pontiac Grand Am. Going to take it across the country to California in about 3 weeks. Based on your comment of not being able to tune, I'm a little unsure whether I will have success. But I will let everyone know. Regarding the Spider antenna, without looking further, who makes that model and where is it available for purchase? I'm curious how it compares in design to the Hamstick or say the Cushcraft mobile antennas.

Hi everybody,

Yesterday I add a strap from the junction J5015 to the chassis to solve the problem of the HISWR on 10 mtb and the result was excellent !

So for this reason I took a picture to help the people who to do this mod by them self.

You can down load this file at the following address :

http://www.egroups.com/files/FT100/HISWR+modification/

On the picture, showing on the left circle is the original strap and on the right circle the one that I made with one inch of coaxial shield.

So if any one have any comments please E-mail me

Thanks to all the people who help me to solve my problem.

Hi Ferdy,

Thanks for posting those GREAT pics of your modifications. Out of curiosity what is the serial # of your FT100?

I had a look at my FT100 and I have the right strap installed only. Serial # is 9I series purchase in February 2000. I occasionally have the SWR problem on keying the mike but only with certain combinations of antenna switches or coax lengths. I noticed a couple of extra pieces of copper tape shielding under the top cover of the FT100 that one can use to put on that center rib and then solder a short strap to.

Thanks again for all of the hi-res photos - nice and clear.

Just wondering too if it voids the Yaesu warranty to install this fix?

4205. 95 F-150 Noise Problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-20 00:55:35 UTC
From: Marty Tippin
Topic: 4205 Message: 4205

I've recently installed a FT-100 and High Sierra HS-1500 antenna on my 1995 Ford F-150 and have started down that long road of hunting down the various noise sources that interfere with HF reception.

Here's the current one I'm working on - any suggestions would be appreciated:

While listening on 40m, I notice that there is an S9 noise whenever I am accelerating - doesn't have to be much of an acceleration, just something other than coasting. While coasting, the noise drops to S5 or so. The frequency of the noise is pretty low and doesn't vary too much with RPM. Oddly, when I press in the clutch but keep the engine RPM about the same, the noise seems to go away. All these observations were made on the way home tonight in city traffic so they aren't precise I'm sure. When sitting stationary in neutral, there is a slight enging noise, with a lower frequency than when I'm moving. In all cases, the noise blanker is effective at reducing or eliminating the noise. I haven't checked to see if the same noise is present on the higher bands; I usually run with the noise blanker on and just haven't spent the time to investigate yet.

This sounds suspiciously like the electronic fuel injection might be involved since it comes on strongest when I am pressing the gas pedal and demanding more fuel.

Any ideas on the problem and possible cure?

Also, would appreciate hearing from anyone else who has installed an HF mobile rig in an older Ford truck (I understand the newer F-150s use some sort of distributed, low-voltage ignition system so the problems in the newer trucks are vastly different than my old junker.)

Thanks & 73,

-Marty NW0L

I'd get the FT-100 - prices are dropping as the dealers close them out. The only difference between the FT-100 and FT-100D are: high-stability crystal oscillator (who could possibly need that in a mobile rig?), CTCSS Decode (for repeaters with a tone on the output), the larger speaker, and the 500 Hz CW filter. All for $1299 or so in the USA. Nobody has confirmed for certain that there are any other kind of internal or programming changes to the D model and similar problems with the D model have been reported as on the original.

The FT-100 is going as low as $959 in some places and the 500 Hz filter can be had for $90 - so if you don't really need the high-stability crystal oscillator and the CTCSS decode, you can save some money and get a perfectly good rig.

I don't know of any way to get the FT-100 to do an offset
on any mode other than FM so I believe the previous
suggestion is the only way to do it.

A repeater that will do other modes besides FM? Sounds
kind of neat to me.

Stewart:
Out of curiosity, what is the split that's being used?
A second thought would be how the "repeater" is ID'ed. Does it use a
beacon frequency?
Sounds a lot like a satelite transponder.

YIKES!!! Yet another fatal FT-100 flaw exposed!!!

I never would have found that bug. We don't have any SSB repeaters in the
US. Hmmm...

Maybe YAESU will fix it in the FT-100E?

According to Yaesu Germany nothing has been changed in the technical specs.
They only added the bigger speakter, CTCSS decoding, TCXO and the 500 Hz CW
Filter.

I think this is just a "trick" to keep the price up. Here in Germany the
price dropped from abt. 1500 $ to 1250 $. The new FT-100 D will cost again
abt 1500 $.

OK... You get a better value but most of us don't need all this stuff ;)
The speaker might be a thing to think about it, but I don't think it is
worth 250 $. And I also think that the components (if bought seperately)
will cost about the same.

4221. Pryme Desk Mics

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-21 01:16:42 UTC
From: Bill Clarke
Topic: 4221 Message: 4221

In the QST magazine there are two Pryme desk mics. The larger of the two look interesting due to the small equalizer on it. Has anyone tried on of these with the FT-100? I also noticed that the company offers adapter cables for the FT-100 for use with these mics.

Hi,

Although I can't comment on it's use with the FT-100 I have their desk mic without the EQ and I use it on a FT-847. It works very well.

Hello Bob!

Here in Switzerland, the dealer which sold me the FT100, seems to be enough clever
to understand the situation, because I ask im to solve this problem and he did succed...

Hope the same can happen for you ...

the serial of my FT100 is 9E003, I bought it in August 99

I think if you do it yourself the warranty will be void. But you can do it carefully. There is already some solder on the copper straps... Connect a braid there and connect this strap to the screw in the middle of the rib.... Then you can undo the change If you have to ship it to Yaesu... ;) And this little solder in the copper? I think nobody will notice it...

One thing which _definitely_ helps are ferrite chokes which you plug onto the cable. Just put them on every cable which runs into the transceiver (the more chokes the better) and most of the RF will stay "outside" ;) If you then also do the "ground" mod, everything should be fine.

At the moment I'm not using it mobile or other than base operation. But it certainly could. They have many sizes of speakers now a days for computers. My son has some very nice ones that are only about 3 inches high. I have used rigs mobile for many years and my ears get use to the bad audio from inside speakers. I also use headphones a lot so my wife can listen to the radio as we go.

Gp,

Paul's comment, I'm sure, was a tongue in cheek comment with regard to other "flaws" found by people on this list. Some of the posts have referred to "flaws" in the rig when, in reality, they were trying to use the rig for an operation the rig was not intended or they just didn't understand which settings needed to be adjusted for proper operation. The SSB repeater concept fell into this category.

Mine's working great for every type of operation I'm trying. Mobile HF CW (20/17/15M) and 2M FM are my main modes, but with the FT-100/ATAS-100, I'm working all the WARC bands, 6M SSB/CW, listening to local air traffic and even finding 460MHz police/fire interesting listening.

Thanks for the info on Linear Transponders.

Not that I'm aware of and it wouldn't really do any good
anyway because the FT-100 is virtually dead on receive
that high.

Oh - not to mention the fact that it's *ILLEGAL* to listen to cellular phone calls! But I suppose that's a minor "technicality"

Why is everyone so fascinated with out-of-band mods?? I'm baffled as to why someone would pay $1000 or more for a new radio and the first thing they want to do with it is "open it up". I wonder how many on this list are nothing more than CBers running the FT-100 ILLEGALLY on 27MHz (or moving on up to the low end of 10 meters when it gets too crowded down "there").

I just don't get it, I guess.

Well, if they wanted a radio to use on C.B. they would have been better
off with something else because most Cobra or Uniden C.B.s will have
far better sounding A.M. than the FT-100 or most amateur radios for that
matter... any other mode and the amateur radio will win hands down.
I don't really have a problem with doing a MARS/CAP mod on radios
but when it comes to receiving stuff that is "out of band" I think you'd
be better off with a scanner, especially since most public safety is
trunked anyway.

Check http://www.qsl.net/w2blc/ft100/ft100.htm

There is a new blurb about the Heil adapter cable.

If you want to do it yourself:

If you examine the module plug carefully, you can see a blue wire on the left side, next is a white wire, and the next over from there is the ground wire. Put a switch and 27K resistor across the blue wire and ground and you have a PTT. Mic audio goes in on the white wire and the ground.

Currently I am using the modified Heil adapter cable and the stock handmike from my 1000MP. I get great reports.

I have been playing around with my FT-100 and trying to do something with the stock poor 6M AM TX quality (6Khz filter).
I think I have stumbled on a way for much better quality. I put a sample of an off-air recording on my website and would be interested in comments if anyone else can duplicate this. The file is about 1.3MB to preserve the audio quality. http://n3jpu.tripod.com/Mobile.html

The main fix was to adjust menu F51 AM Carrier Level from the default of 119 to 225. I also set the RF PO out to 25 and mic gain to about 50.

It worked and it did not erase the memories that I had programmed in. Many thanks Gary. For the record, when he's speaking of the AM carrier level, that does not mean the am power output. The power output is one adjustment, but the carrier level, using the second set of menus (the undocumented ones) is the thing, being set much higher. There seemed to be some confusion about this earlier.

I think if you do it yourself the warranty will be void. But you can do it
carefully. There is already some solder on the copper straps... Connect a
braid there and connect this strap to the screw in the middle of the
rib.... Then you can undo the change If you have to ship it to Yaesu... ;)
And this little solder in the copper? I think nobody will notice it...

One thing which _definitely_ helps are ferrite chokes which you plug onto
the cable. Just put them on every cable which runs into the transceiver
(the more chokes the better) and most of the RF will stay "outside" ;) If
you then also do the "ground" mod, everything should be fine.

Rocky,

There has been freqs & times sent out but not to many operators checking in. Band
conditions have not been that good either. It was discussed that every
Sunday 18.140 @2300z if busy then 18.150 2305z, or 14.240 @ 2315 for better
conditions. I did not hear any one yesterday. We can try next Sunday if any
one is interested. I'll be in there.

4249. FT-100 Hidden Menu Settings

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-24 12:45:38 UTC
From: jerry
Topic: 4249 Message: 4249

I have a question regarding the hidden menus of the ft-100. What exactly does the below menus mean:
F13-HF PO 10W
F14-HF PO 50W
F15-HF PO 100W
F16 50 PO 10W
F17 50 PO 20W
F18 50 PO 50W
F19 50 PO 100W
F20 70 PO 10W
F21 144 PO 20W
F22 144 PO 50W
F23 430 PO 20W
Should all these setting be set to the max or what? Thanks for the help. My FT-100 was purchased in Apr-2000,Ser#-9D021xxx. I had the HI-SWR Icon,sent it back and all is working flawlessly. Again thanks to the group. I have learned a lot.

Subject: RE: [FT100] AM TX quality fix

It was a subjective test, but I think a good one. I called a fellow on telephone, had him monitor an appropriate frequency, and asked him to give me a signal check. He reported that it was okay, but somewhat garbled. This was with power output set to 20, and microphone gain at 50. I asked him to stand by, made the change to menu F51, and then called again, the delay being about 20 seconds. He came back with "whoa, that fixed it, what did you do?". A subjective test, but a good one I think- grin.

Subject: [FT100] AM TX quality fix

I have been playing around with my FT-100 and trying to do something
with
the stock poor 6M AM TX quality (6Khz filter).
I think I have stumbled on a way for much better quality. I put a
sample
of
an off-air recording on my website and would be interested in comments
if
anyone else can duplicate this. The file is about 1.3MB to preserve
the
audio quality. http://n3jpu.tripod.com/Mobile.html

The main fix was to adjust menu F51 AM Carrier Level from the default
of
119
to 225. I also set the RF PO out to 25 and mic gain to about 50.

I agree Marty. I have found that when running mobile, it is too easy to accidentally dial "out-of-band" and attempt to transmit (or TUN) there. I recently removed the "out-of-band" mod on my radio and have not regretted it, cause it's hard enough to drive and dial (which I admit I shouldn't be doing anyhow), let along look at the radio while dialing to be sure you are within band.

I also find myself using the "Memory band edge" mode where I have programmed the edges of the bands to my priveledges and modes of operation. This allows me to dial, listen, TUN, and transmit without having to look at the dial and look at a freq chart to determine if I can transmit.

Another note, I make sure to keep within 3kHz from the band edges when transmitting. I heard someone the other day transmitting 2 kHz below the top of the Amateur band. Isn't this is illegal if you are modulating with an ~3kHz signal that bleeds out of Amateur band (which these 2 operators where)?

Hello Dan & Everybody!

I use my FT100 for during a trip to Africa with a 4x4, when I get back to Switzerland
I dicide to block again the mod, I did it step by step without touching anything with the
jumper, but it was impossible to block again the "out of the band" and since that time I
can't do in CPU reset ?????

Did you do something with this the jumper?

If any one have an idea about this thank you very much in advance...

4258. FT-100 Upgrade speaker cover

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-26 04:48:17 UTC
From: Powerwerx
Topic: 4258 Message: 4258

About a month ago I posted to see if anyone was interested in upgrading to the new speaker / cover for the FT-100. I had quite a few positive comments.

Unfortionately, the parts have not arrived from Japan, but the approximate price for all the parts necessary to make up the upgrade has arrived. It looks like Yaesu will want around $49 for each complete set of speaker, cover, bracket, screws etc.

Powerwerx plans on stocking a few of these units when they arrive in 4 weeks. Due to the high price we will not stock too many until we see what the demand is for the unit. We will, however, sell the parts completely assembled as one unit.

This email is just an update to my previous post. Since they are taking quite a while to arrive I thought that I would let the group know of the status of these parts.

Remember, the $49.00 is Yaesu's price, not mine. No flames please.

Slight confusion here guys, I think!

Isn't the ct-62 cable (the one that goes in the BAND DATA pigtail and has the level converters in it) the one used for computer control of the rig? Shouldn't we be talking about the ct-39 cable? Which uses the DATA jack. Or am I getting really confused?

To work psk or rtty you need in the first place the ct-39 (for audio afsk input and output and for PTT), if you want to communicate with the FT 100 for data read out (frequency, mode, etc) you need the ct-62 as well.
PTT can also be done under software control then the ct-62 is needed.

I am not the brightest bulb in the box - so forgive my asking - but why should someone buy Yaesu parts from anyone other than Yaesu?

Now I may be wrong, but it seems that you are suggesting that you will screw the new speaker into the new FT-100D top cover for your customers for some additional fee. Is that the advantage of buying the parts from Powerwerks?

This is a serious question, not a slam or anything like that.

4265. Problem using Packet

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-26 12:27:14 UTC
From: Lorenz Grassl
Topic: 4265 Message: 4265

Hi folks!

I wanted to use my FT100 in packet-mode (1200bd) but my modem does NOT
recognize incoming data. Audio-signal is detected (LED goes on when audio
appears) but no data on the screen.
Transmitting works ufb.

When I connect the cable to my Standard C500 handy, data is recognized well.
I listened to the signal, it sounds a bit distorted and compressed. (DATAout)
I tried to link the speaker out to the modem (with and without the
recommended attenuator for headphone) - there was no success...

Any comments?

Hopefully awaiting...
Lenz, DL8RDL

Paul:

A legitimate question, I'll give you a serious answer.

First, have you ever bought parts direct from Yaesu? Quite some time on the phone at your expense. Then you have to dictate all your info to them on the phone. Should take you about 15 minutes per order.

Second, they usually don't have a lot of special parts available and they have to be ordered from Japan.

Thirdly, Powerwerx.com has ON LINE transactions. You can order any products any time day or night. In the confines of your home or work.

Lastly, we are an authorized Yaesu parts distributor. In most cases we sell parts the same as Yaesu.

The speaker was going to be stocked as a convenience item to the list. Factory parts for specific radios are not really what are company sells. We are in the power connector business. But being a ham always keeps my mind going for all the new radios. As I like all the toys too.

Are you using the correct output-pin? When I connected my 9k6 modem I first
used the incorrect pin. There was also some audio on it, but not the
korrekt audio. Try to check the cable again. That helped at my station.

Another thing might be that you have not selected the right packet mode.
Make sure you selected 1k2.

If you can live with an outboard speaker, try this: I recently
bought
a Radio Shack communications speaker. They have several; this is 4
inches in diameter and sells for $14.99. MFJ makes a 3 incher for
$12.99, but the HRO salesman said it sounds "bright" (tinny?).

Anyway, the Radio Shack speaker sounds great on all modes, infinitely
better than the built-in speaker. Mellow without being muffled.

It's in an ok black plastic case which actually looks ok next to the
FT-100. Wish everything which is that much of an improvement only
cost $14.99

Paul

Hey, y'all..

My Name's Jay, callsign: N9WMU
Location: Richmond, VA

I've become pretty active on 2M Sideband, and am currently completing my study to upgrade to General Class in the next month or so..so I went ahead and bought the FT-100! What a radio! This is the impetus I needed to get off my dead ass and get the license upgrade..a radio this well built deserves to be utilized as much as possible!

My full profile is on QRZ.com.

I'll be going through the archives in the next week to get up to speed. I purchased the FT-100, NOT the 100-D. I think it was a good choice either way, and am looking forward to becoming an enthusiastic ROAMER.

Looking forward to any and all advice you experienced owners can give me!

73,
Jay
N9WMU

Hello Paul...

Thanks for you message... I will try to get myself some sort of external speaker... Unfortunately we don't have shops like "Radioshack" where they sell such sort of equipment that cheap. You get external speakers.. but they cost more than 14 $;(

But thanks for the tip.. The speaker is definitely something for mobile or fixed operation. For portabel operation it is not very handy... Normally I use also headphones on portable operation. Doing this I do not "bother" my surrounding ;))

Hello Jay....

Congrats to your transceiver... I really like this radio and the flaws it has are really minor. Except this SWR thing, but there is a quick and easy fix available.

Packet (9k6) works perfectly and Pactor (I and II) operation is also possible. Even with the narrow CW-filter, which definitely improves receiving quality...

Another thing which I DO like is the DSP. Never had DSP before and I think it is quite effective on this radio.

My reply to a net is: I was on 18.140 Mhz on Sunday at 2300 UTC and the band was dead except for one week DX station up the band. Only one Sunday has there been a group one 17M (small group at that).

I would recommend to move to 20M as I stated some weeks back as more stations have good beams on that band. Originally the suggestion of 14.240 Mhz was posted and I would suggest that if someone can find a hole between 14.240 and 14.250 Mhz at 2100 UTC and announce that you are calling an FT-100 net you will get takers.

I took the original posted list of stations and the additions that had been on other week on 17M and tried calling each call Sunday and didn't have any takers.

I will be mobile and listening/ready to get in while coming southbound from Flagstaff, Az. Ft-100 and Atlas-100

4291. Mute

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-28 09:14:37 UTC
From: dines@ew.co.nz
Topic: 4291 Message: 4291

Hi everyone,

I have noticed with my FT-100 that some Frequency on 2m I have to wind the mute around a lot more to quiet the radio which is fine on that particular repeater but it will now be deaf on most other repeaters, this makes the radio next to useless in the scan mode as it stops at almost nothing. (I tried removing the antenna and placing dummy load onto the pigtail and checked the mute levels but they were still uneven) could the problems be caused by the settings in my menu 2. which have been set at factory so different from the ones on this news group earlier (the only two which are the same are the ones for over heat).
Any help on the above would be much appreciated.

Christian,
Actually Heil ProSet with a HC4 mic right out of the box plugged in and off and running! Set the mic and vox levels per the FT100 manual. Went on 10 meters a couple nights ago and wham! everything working great and sounding fine. I had an old Heil headphone and could not get it to hook into the FT100 so I just their new version with the right cable. I will be driving to california in a couple of weeks and I'll let all know how the rig works out. I will work 10, 20, and 40 meters with a Hamstick mobile antenna.

As previously mentioned by many we've tried 17m @2300z and 20m but no one has around.

Lets try 20m @2100z as suggested recently say 14.240 + - qrm.
I'll give a call and be listen so lets try to get a few stations in there.

I have a birdie on mine as well, being 145.410 that never has gone away. I blocked that one from the scan, and it works fine. You can choose something, skip I believe, to tell the radio not to check that one on a scan.

Subject: [FT100] Mute

Hi everyone,

I have noticed with my FT-100 that some Frequency on 2m I have to wind the mute
around a lot more to quiet the radio which is fine on that particular repeater
but it will now be deaf on most other repeaters, this makes the radio next to
useless in the scan mode as it stops at almost nothing. (I tried removing the
antenna and placing dummy load onto the pigtail and checked the mute levels but
they were still uneven) could the problems be caused by the settings in my menu
2. which have been set at factory so different from the ones on this news group
earlier (the only two which are the same are the ones for over heat).
Any help on the above would be much appreciated.

Just got the FT-100 in the new car - thanks to all for sending me pictures of the installations! The control head is the only remaining thing to mount, but that's not a big deal at this point.

I also bit the bullet and got the ATAS-100, only to find out it doesn't do 80m! My favorite nighttime band ... gone! Any suggestions? Should I have gone with a different antenna? Is it too late for me? ;)

Only if you're in a place where it's illegal. Some places it's not. In fact, even here in the USA, it used to be legal to listen to whatever you wanted to listen to. But some politician got pissed off because someone overheard him doing a deal over his cell phone, and that's why it's illegal here. Stupid, stupid, stupid - and if you support laws that allow people to cover up their own criminal activity, I really feel sorry for your lack of vision. This sort of asinine nonsense will be the death of this country.

Oh, please. There are many reasons why a modded FT-100 would come in handy, and some of them are even legal! Besides, if the CBers what to run a kilowatt on 27 MHz, why should you care? At least it keeps 'em out of the lower end of 10...

4303. 1998 Chevy Blazer installation

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-29 09:20:46 UTC
From: Ed Carp
Topic: 4303 Message: 4303

Finally bit the bullet and got another vehicle, a 1998 Chevy Blazer. Love it, but where to put the radio? It's just a little too thick to put under the back seat...but...hmmm...what's this? A big space, just large enough to put the radio, exists in the compartment where they stowed the jack!

Well, that fixed the radio problem, but how to run the coax for the antenna? I'm running a ATAS-100 with a Diamond K400 mount (very nice mount!), and as I peer under the car at the rear, I see what looks like a drain plug. Hmmm...not only is it a drain plug, but it's a drain plug with a hole in it! Perfect size for running coax. Add a drip loop onto the end, and mount the K400 to the tailgate. Looks good!

Now to run all those cables somewhere convenient. I get out the screwdriver, only to discover that there is a God after all - and he must be a ham! All those little trim covers at the bottom of the doors on the inside just pop off - perfect for running power and remote head cables underneath!

The only hassle is where to get power from. I had to poke a hole in one of the rubber grommets in the firewall (and that was a real pain!) and run 10 gauge wire to the battery. But, after all was said and done, it works great!

My best friend has a BMW X5 that we'll be installing either a FT-100 or a IC-706 into soon - it looks to be even easier, as the battery is at the back of the vehicle instead the front. :)

I found that in my Ford Ranger installation that A.M. reception was almost impossible without the 6KHz filter. The receiver was just too wide and I had a BIG problem with fuel pump noise... as soon as I installed the filter the fuel
pump noise was cut in half and I could actually hear things.

I don't know if there are any specifications anywhere. When I
was considering the ATAS-100 I was hoping Yaesu might have
had information about it on their website but no luck there.

What specifications are you looking for?

The antenna is supposed to cover 40 thru 6 meters and then
2 meters and 70 cm. VHF/UHF use is okay... no gain. While
the specifications are "guaranteed" for 40, 20, 15, 10 and 6
meters, if the antenna is installed well and grounded good you
should be able to get the antenna to load up on 30, 17 and
12 meters.

My take on the situation is that if it goes out over a radio wave then it becomes public domain. If you don't want anyone listening in then encrypt the signal. I seem to recall many years ago when satellite dishes were first becoming a big thing (and they were big in size then, too) that some gentleman in New York, I believe, was receiving HBO free of charge. How he got caught I don't know, but what it came down to in court was the judge ruled just as I said above. If HBO didn't want this man receiving their transmissions without paying for them then they needed to scramble the signal before going to the satellite and that's what they did. This country really bothers me with some of the stupid and nearly impossible enforcable laws it comes up with. In regards to the comment made above, it was illegal to monitor cell phones before the Newt Gringrich fiasco... but the stupidity of the people that received his call is what brought to everyone's attention. Up until then, most of the public wrongfully "assumed" their calls were private and secure... mostly because that's what the cell phone industry was feeding them. With all that said, I don't know what the big deal is with listening to cell phones. I have a scanner that can do it and I've listened, but for the most part is kind of boring (personal preference I suppose). It's only a matter of time though before any scanner capable of receiving cell phones will become obsolete since there's a migration to either CDMA or GSM in progress. Soon there won't be any analog cell phones.

Without the optional AM filter XF-117 absolutely ANY AM reception will be rediculously wide. This is a sore point with me... I think a proper filter should be in the radio to begin with.

Hello Fred -
I do not have the 6kHz AM filter, and often WWV on 10MHz is wiped out by adjacent broadcast stations.
Here are results of an experiment on my FT100. Around 7MHz, a signal at S9 will be S1 (bargraph S-meter) if its carrier is 30kHz away from the dialed-up frequency.
A station can be off-frequency by up to 25kHz and be very good copy.
It's possible to tune an AM station off-frequency by 1.2kHz or tune it as sideband and use the 2.4kHz filter. Narrowing the IF helps with noise blanking, too.

To be correct, Ronald Reagan did the first major re-write of the communications act of 1934 which lead to the regulation to what you could legally receive. It used to be you could receive anything you wanted, but couldn't repeat it. The CTIA (cellular lobby) was getting pressure about privacy, and got the law passed to make it illegal to sell scanners that could monitor cell phone calls, and later during the Clinton administration did it become law you could not monitor cell phone calls.

Newt Gingrich, who was fighting a battle over his quasi-legal GOPAC, was told not to solicit votes in his favor with the house. He agreed to this, and of course did not abide by the agreement, and was caught on a cell phone lobbying on his own behalf. The law didn't change, but did get enforce.

They should of never touched the original act of 1934 and forced the CTIA to implement digital cellular phones, which they eventually did anyway.

Newt Gingrich, how we miss him, NOT!

You you could ship it down to me and I will send you my DK-3 build by none other than Don Johnson . The DK3 cover 80 -10 meter and if you remove the whip It will resonate on 6 meters. No 2 or 70cm with this one. Don Johnson was the original inventor of the "screwdriver antenna"
Just a wild thought that came into my mind Ed as I don't get out much at night and would not miss the 80 meter band!

Actually, from what I understand, at least here in America, the new standard in the next couple of years will be wideband CDMA. I knew that GSM had been cracked by some people over in Egypt, I believe. Nothing is totally secure I guess.

Had been calling "cq ft-100" or "cq egroups" at 14.245... Only one dx-net
operator came back and asked me to make qsy ;)

Was actually hearing US-stations on 14.239 but could not figure out if
there are talking abt. FT-100

Steve, you need a special fuel-pump filter to wipe out the noise. I can source them for less than $50. I forget the exact price.

Actually, I've already tried that. The dealer where I bought the vehicle from
installed the noise filter under warranty. The noise filter was on there for
two months and did nothing to reduce or eliminate the noise. Then one day
after filling up, the truck wouldn't start. It was like the truck wasn't getting
any fuel. The vehicle was towed to the nearest dealer under warranty but they
couldn't find any problems. The vehicle was returned to me two days later.
Then four days later the same thing happened. This time I had it towed to the
dealer where I had the filter installed. They looked at the vehicle and found
that the fuel pump had failed. Cause: Unknown. They installed another fuel
pump free of charge but they left the noise filter out since it didn't do anything
anyway. I found it to be frustrating that my $1300 amateur transceiver couldn't
filter out the noise with it's noise blanker but my Uniden HR-2510 could kill
the noise completely without distorting the audio on A.M. like the FT-100
if you turn the N.B. up all the way. I continued working on the noise problem
by grounding the cab and bed of the truck to the frame and that took care of
even more noise. Then when I mounted the antenna in the rear corner of the
truck instead of behind the cab, the noise was reduced even further. You
can still hear it when using A.M. but it doesn't show up on the s-meter anymore
so it's livable.

From: Brian Smithson
Topic: 4232 Message: 4327

Good morning, everyone!

I recently picked up an FT100D and it seems like a nice little rig. My plan is to take it on business trips, etc. I wonder if anyone has ideas or suggestions for mobile antennas for hotel use that are easy to pack, tune, etc.

Any suggestions?

Tnx es 73!

Well this could be the start of an intersting thread.

For VHF, small antennas shouldn't be a problem but I doubt that's what your asking. For 2 meter FM an HT is the ideal travel radio.

For HF in a hotel I would suggest versions of mobile antennas and clamps to balcony if you have access. One of my friends bought what he called an 'manual screwdriver' antenna at dayton. Don't know the manufacture but it was related to the QRP community. It had the sliding contacts on coil approach like a screwdriver but was done manually. Quite small and should resonate what ever you could stick on the end. Maybe a short wire rather than a whip or several short pieces of aluminum tubing that could be nested for travel and extended for use.

If you are driving and can install a mobile antenna, another friend often gets a ground floor room and just extends to coax from the room out to the car antenna system. Allows you to set in a comfortable chair, with good climate control and operate. Another trick he uses is an automatic antenna tuner (he uses the SGC) and throws wires into the bushes/trees. He clips the wire to the end of his mobile antenna to increase its size & efficency and the tuner matches it up.

Take many pieces of clip-on ferrite because the radio is sensitive to RF on the coax from poorly matched/gounded antennas. You may need to add these to the coax, (at the radio, at the antenna), maybe to the DC leads. What ever.

What is you plan for power supply? Some of the new switchers seem quite light.

My $.02. Others?

4330. RE: [FT100] Hotel antennas

Yahoo group: FT100 (1998 — 2000)
Date: 2000-07-31 16:43:57 UTC
From: Charles Scott
Topic: 4328 Message: 4330

Brian:
I don't think anyone else has suggested this, but it's an approach I've used in the past with some success. Ask for a top floor room and toss a weighted light gauge insulated wire out the window.
You'll of course have to use an outboard tuner since the one in the FT100 won't be too happy feeding a random wire. A simple "L" match should do the trick, or you can use one of the cheap 100w manual tuners. If you want to get carried away, get a LDG tuner, which is small enough to pack into your luggage.
It helps to have something to hold the wire slightly away from the building, at least a foot or two. You can use fairly light guage to make it less visible and if you come prepaired with a couple different colors, you can select one that's nearly invisible against the building.
Grounds are a problem, but since many hotels have an air conditioner right at the window, that's a good place to clip onto. I've also had good success connecting to the window frames for a ground, although sometimes that doesn't seem to work well, perhaps sometimes they're not connected to any metal in the building.
Some of the drawbacks are a tendancy to draw RF arcs to your fingers from the radio if you don't get a good ground or end up tuning the antenna funny. Another is the potential to interfere with TV's and other things in the hotel, but that can happen regardless of the antenna. Just make sure you only run full power the last night you're staying there.

Good luck!

Chuck - N8DNX

I stayed between 14.240 and 14.245 most of the day Sunday and heard on station calling but there was a QSO going on. They let me break in and make a call a couple of times but heard nothing. We had weather come through and had the station down during the time we would normally hear some of you on there.
Listen for me on the WWD net in Jacksonville Florida @ 2330 UTC on 28.390 USB. I will be net control tonight(Monday) and you can Email me or message me @ KG4FET on AOL and Yahoo messenger or @ ICQ # 55135435. If you can hear us but we cant hear you feel free to message me and one of us can swing a beam in your direction. WE are here each Monday night and there are several FT 100 users that check in.

Topic: 4335 Message: 4335

Hi.

I just joined up with the FT-100 egroup the other day. I purchased the FT-100 last week and I'm having lots of fun with it. I'm trying to catch up on all the old messages.

Just wondered if anyone hass designed a keypad entry unit for the FT-100? A buddy of mine owns the 706MKIIG and he purchased a kit from someone in the U.S. that allows the users direct entry of frequencies into the Icom....sounds like a neat idea. Is there such a beast for the FT-100?

Thanks

Steve, VA3SC
Oakville, Ontario

(I'm sure I'll be back with more questions)

Hi Steve...

There are severl software-packages which allow remote controlling of YAESU
rigs. Yaesu itself does not produce any type of software....

Unfortunately I don't have any links here... Just read it somewhere...

Sorry...

One thing you definitely need as a RS-232 <=> TTL switchbox... Look into
the ARRL Handbook 2000. They have IIRC a circuit...

Hi Christian,

Sorry I didn't hear you but was mobile and called "CQ FT 100 Net" from 2100 to about 2110 on 14.2405 as I could hear the fellows on 14.239 and had listened to them a few minutes and didn't detect any talk of Yaesu. They were light signals into Flagstaff AZ.

I had heard the DX folks on 14.245 and tuned around until 2130 when I changed to 40M to listen to a swap net. There was also traffic that I could hear at 14.250 just before 2100 so that is why I moved up just a bit from 14.240 and couldn't hear any interference from the 14.239 Mhz traffic.

I will say that the band was not very good during my drive home which was from 2045 UTC to 0400 UTC.

Look for you again next Sunday,

I've just been told by Yaesu, that they want $230.00 to fix the Bad UHF/VHF side of my 8 month old FT-100.. This after Returning a FT-100D
for not beaing able to function with my ATAS-100 antenna. This UHF/VHF
problem is a known issue with Yaesu, along with the bugs in the FT-100D, What seems to be there problem? I have a FT-847 here in the house, a FT-8500 in the house for the APRS station/Back monitor the local machine, FT-50RD for working and playing, And never a problem. I've never had a problem with any of my yaesu equipment, but the FT-100 series is trouble! After returning the FT-100D and placing an off-setting order, I put my IC-706 in the car and it works fine with the ATAS-100, and the original FT-100 did also. I ordered an IC-706MkIIG for the car, and not sure Yaesu will receive any more of my buisness, after this radio (Under Warranty) is held hostage, along with a $30.00 fix on the the 6Month old ATAS-100, I think I'm taking my radio purchases elsewere....Remember, Yaesu knows of the problems with the radio, These shold be fixed before they leave the factory, not wait for a return, UNDER WARRANTY, Then told you pay for the fix...This is not the way to treat your customers!...Jeff-N8NOE

Don't feel bad.....

I just today received my FT100 back (9E serial #) after sending it in for the high-swr indication/ loss of power on 10m problem. It all started in March..

I sent the radio in for the first time in March due to the well-known HF output power failure due to a FET failure in the driver stage.

Got the radio back in Aprill. Also received the radio back with a nice 2 inch scratch in the top cover. The radio was in as-new condition when I sent it in, but I figured why complain, after all, the radio was repaired, or so I thought!

In May I started having the intermittent SWR problem with what appeared to be an oscillation on 10m. I ignored it for awhile. It became worse over time. Then I decided to send it in for repair. I also mentioned in the accompanying letter that I was unhappy with the fact that they scratched up my radio the last time it was in their hands.

I received the radio back in mid-June. The invoice stated that they replaced the top cover and "performed all necessary upgrades", but no mention of what was actually done. Upon unpacking the box, I noticed that the Vol/Sq control shaft was bent, the plastic knobs were damaged, and the front panel was cracked due to severe force being applied to the front of the radio. No "apparent" damage to the shipping box, just that the side was pushed in ever so slightly. I immediately called Yaesu Service, who stated that UPS must have damaged it in shipping. I stated " why yes, they probably did, but your piss-poor packaging method was more to blame than UPS. (their packing consisted of putting the radio in a plastic bag, and setting it in some crumpled brown paper.) During shipping, the radio slid in the brown paper wrap to the point where the front of the radio was touching the cardboard box. Real lousy job, considering I packed it with bubble wrap 5-10 times around the radio, then sat it in plenty of peanut material in an oversized box, when I sent it to them. One would think they know how UPS handles packages by now!

One week later, UPS comes to pickup my radio to return it to CA for the local UPS rep to inspect. This occurred only after calling UPS because they dropped the ball on the call tag issued by Yaesu. Seems the driver "forgot" to make the pickup three days in a row! A week later I called Yaesu for a status update. They stated that UPS will cover the radio to the point of replacing the encoder controls. I reminded them that I stated in a well-written letter to them that at a minimum I wanted the front control unit replaced, since they could not guarantee me that the front panel's circuit board may or may not act up in the future from the severe force it was subjected to. After bringing my saga to the attention of John Lynn @ Yaesu, he got involved and

was able to finally get UPS to cover the relacement of the front panel subassembly. You would have thought that they would have read this in my lettter accompanying the radio!

Well, today is July 31, and I just received the radio back for the third time, almost two months after sending it in. The radio arrived in one piece, in good physical condition, amazingly, as it was packed as poorly as last time!

We'll see how it goes during the next week of mobiling to work.....

Sorry to bore everyone with my saga. I usually stay quiet and observe others discussing their misfortune and nerve-racking experiences. But after what I have just gone through, I had to add my two cents. Hopefully things will improve with the FT100D.

I hope this is the end of my FT100 headache. If the radio fails a third time, it will be the last. Maybe the "lemon laws" of NJ can be applied to ham radio gear? Hopefully I won't have to find out!

I really hate to hear about the way Yaesu has taken care of some of you folks - as I wait for my FT-100 to be returned from them. I hope they are isolated instances. Hearing about the packaging problem has been troublesome, too. I sent them my unit packaged in the original box! I had a feeling that that was going to be a bad idea but I wanted the rig to get to them "as new" which it is - only a couple months old. If they don't send it back in the same box I'll not be very happy. I have the original box for all my equipment - even the ones I purchsed pre-owned.

A note of interest to all: When I contacted Yaesu about my CW 500 Hz filter they told me what I had to do in order to ship it off to them. They never mentioned that I had to send them a copy of my invoice to "PROVE" the unit was still under warranty. When I got the call from this very nice and friendly YL asking me to send her a copy of the "proof of purchase" I told her that I had already sent my WARRANTY card to Yaesu so they should already have the information on file. She told me that the Warranty cards go to a different location and they have no way of tracking them.

Sometimes I am a little slow but I think I have this one figured out! You see, they don't really want that card returned so you can get warranty service performed on your equipment. I think they take the information on the card and sell your information to whoever wants to pay for it. Why else would they want to know what your interests are ... how old you are, how much money you make and do you own your own home! I don't think they wanted to know if I could really afford one of their new & improved FT-1000. They are not the only ones doing this. The next time you buy anything with a warranty card, check it out. I'll bet that it'll never make it to their service department.

Here's praying that I get my "NEW"ly repaired rig in one piece and in its original box ... and the loud popping sounds gone when the CW filter is selected!

Hey guys,

Has anyone brought their credit card (the ones that offer guarantees) into the mix on this?

Just a thought.

I have had great success using a ATAS100-the mount is an electrical utility box with a SO239 barrel conector through one of the knockout holes-the box has a flange which allows me to clamp the whole assembly to a balcony railing-for ground wires I u se 4 20' strips of ½" braid with eye holes at eache end-simple to attach to the electrical box with butterfly bolts.

Huh? It is under warranty if it was bought new by you 8 months prior. Is there more to the story? Otherwise they fix it free. Right?

if you're referring to the extended warrantee, i've tried on a dual bander i purchased a few years ago. the credit card company stated that their extended warrantee "doesn't apply to mobile radios."

It doesn't matter so much what your credit card company "told" you as what their extended warranty program description actually states. If it is not excluded, either by specific or general description, or by type of damage/loss, I believe it IS included.

I would also like to hear from others with experience on this issue.

4349. Ford Fuel Pump Noise

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-01 20:54:35 UTC
From: ad6ez@aol.com
Topic: 4349 Message: 4349

Hi Gang -

I am one of those with an FT-100 installed in a 1997 F-150 pickup with fuel pump noise and some ignition noise too. After a month of trying to get inforamtion from Ford they finally gave me the part number (F1PZ18B925A) for the RFI filter that must be installed (soldered) to the fuel pump itself. The cost of installation and part wil be $218! It seems that they have to pull the fuel tank to get to the pump. I remember someone on this list saying that they decided to get the ClearSpeech speaker instead of the "fixes" for his ford vehicle and that it worked great. The noise I have is worse in the vhf/uhf bands. Will the ClearSpeech speaker take care of this? The speaker costs about $150 compared to the $218 for the RFI - and there is nothing to say that the RFI filter will remove enough of the noise to make a difference anyway! I would like to hear from anyone out there who has opted for the RFI fuel pump filter and/or the ClearSpeech unit and their results. Thanks ....

You don't have to send in the warranty card to validate the warranty (those guys in DC do, sometimes, do things that help us). I think the reason for the need for the invoice copy is to verify that you are indeed the "first owner". Yaesu's warranty is not transferrable,
in spite of what certain sellers imply in their ads.

Sounds like way more than we're being told. I have NEVER know Yaesu not
to honor their warranty. In fact, I have had a rig fixed "gratis"
several months OUT of warranty as a goodwill gesture. Perhaps Jeffrey
put his hands in the rig voiding the warranty? Sorry Jeff, your story
doesn't make any sense. If you didn't void the warranty by doing
something really stupid, then WHY didn't you ask for a customer service
supervisor and resolve the issue? Yaesu, perhaps to your surprise, isn't
in the buisiness of holding your rig hostage just to get your money.
Grow up.

I agree. I had mine a little over a month and it went up in smoke. The
entire ouput board was burnt. The cost that Yaesu indicated on the return
invoice was about $380!!!!!!!! However, they did not charge me a penny.
The only thing I did not like was the fact that the $0 invoice had a note
on there stating that all replacement parts are only warranteed for I think
60 days. So I guess if I toast the output board again it's on me! Seems
like a strange policy to me since I thought I had a year parts and labor.
But for now it is working great.

Seems that these "heil" sets are the non plus ultra concerning headsets...
Heard quite a few persons using them...

And this mic just plugs into the ft-100? Where do you get the audio from?
Speaker-outlet?

I'm sure you are all wondering "Where is Yaesu in all of this?"

We've been busy trying to locate Mr. Swigers radio, or Mr. Swiger himself. We have no record of either an FT-100 or FT-100D being returned under the name provided. Also, an email requesting more information (sent to the address listed on the FT-847 bulletin board) bounced back as "User Unknown." No response as yet from the "arrl.net" address used here on the list.

If there is more information provided, we will gladly research this claim. Until then, regrettably, we can not be of much assistance.

Look at QRZ.com for control software or eham.com for links to
software companies for the control software for the FT 100. RT
systems is still producing control software although the equipment
sales end of the business has ceased (too bad too, they were great
guys to deal with).

I have posted a couple of time on this matter. I would like a copy of the article from the May 99 QST with the PSK 31 hook up for the FT 100. I have the software and have been watching signals for a week now and I can't wait to get on the air. Could some one send me a copy of the schematic or a copy of the article, or upload it into the files area for everyone who might like to give PSK 31 a try? I have played Heck trying to find someone around here with a copy of that issue and just cant find a soul.

Hi Mike,

Does a Canadian purchased FT100 have to be sent to Cerritos for warranty work or can an authorized Canadian repair center do warranty work? Are the Canadian authorized Yaesu repair depots aware of all the warranty work e.g. - swr problems etc?

From: Marty Tippin
Topic: 4349 Message: 4362

Hi Denny -

I just installed the RFI filter in my 95 F-150 last weekend - took about 2 hours with the help of a buddy. Not really that hard at all, and certainly not like I thought it would be. Just a matter of dropping the fuel tank, removing the fuel pump and splicing the filter into the power leads going to the filter. Rocket science it ain't! If you're at all mechanically inclined (or have friends who are), you can probably tackle this one yourself. Just be careful around gasoline but there's no need to be paranoid about it.

The filter works like a charm too - I have dual tanks in my truck and only installed it on one, so that I could tell the difference (and just in case the first one didn't work) - I go from S9 noise on 17m AM on the un-filtered tank to absolutely zero noise on the other tank (doing the "turn the key on but don't start the truck" test). I still have a good deal of ignition noise to work out, but the fuel tank noise is gone. I'll install the other filter after I've reduced the ignition noise, as that noise is worse than the fuel tank noise. Note that I haven't listened for the noise at VHF or UHF as I only operate FM there and noise like that isn't a problem.

The part costs $56 from Ford - all for about $5 in parts and plastic molding. It's a rip-off for sure, but then, there isn't much other choice if you want to fix the problem. Labor is estimated by Ford at 2 hours (at $80 locally).

FYI - the information you needed to give Ford was the number of the Technical Service Bulletin - 99-12-9 - that would have saved all sorts of time on your part; it's likely the person you were working with at the dealer had no idea what you were asking for. The part number of the RFI filter is listed in the TSB as well as the installation procedure. A copy of an older version of that TSB is available on the ARRL Web site at http://www.arrl.org/tis/info/fuel.html - I've sent a copy of the newer TSB to ARRL and they'll be updating the web site soon.

I"m here and just got the message, I've sent a list of radios here, and some of the names.. I explain to all, I have nothing in my name, Not even a credit card (till a month ago), The EX!-YL, can't touch it if it isn't in my name.. Please check a list sent to Yaesu, There are a few radios and 2 ATAS-100 antennas. Unfortunatly, no #'s for the antennas... This is the first time I've ever had a problem and sent somthing back for somthing like this, but after all the equipment, there has to be lemons! In my opinion the FT-100/100D hasn't been suficiantly tested by Yaesu and released prematurely to fight Icom.. The IC-706 in the car works fine, and I got word today the IC-706MkIIG
was shipping to me today. The tunner is here, the radio was back ordered. Seems as if the ICOM's cant keep in stock, and the FT-100's they've got tons of in the warehouse's now, PLUS 1 MORE!... I get the FT-100 here, I'll be posting on the return condition.. I'm typing this
now because I knkow it has been sent on t he way back, and it will arrive in here about Friday....73 Jeff-N8NOE

Mr. Swiger,

Thanks for the email. As noted by some of the previous postings to this list, your case is unusual, and must be looked into. To do this, we require the name under which your FT-100 was returned, or the serial number of the rig. If we find that you were charged in error for a warranty repair, we will gladly issue
you a credit for the amount of the overcharge.

If you'd prefer not to post this information to the list, my personal email (at
work) is mkrueger@.... I can also be reached by phone at 562-404-2700 ext. 242.

Subject: Re: Ford Fuel Pump Noise

Hi Denny -

I just installed the RFI filter in my 95 F-150 last weekend - took about 2 hours with the help of a buddy. Not really that hard at all, and certainly not like I thought it would be. Just a matter of dropping the fuel tank, removing the fuel pump and splicing the filter into the power leads going to the filter. Rocket science it ain't! If you're at all mechanically inclined (or have friends who are), you can probably tackle this one yourself. Just be careful around gasoline but there's no need to be paranoid about it.

The filter works like a charm too - I have dual tanks in my truck and only installed it on one, so that I could tell the difference (and just in case the first one didn't work) - I go from S9 noise on 17m AM on the un-filtered tank to absolutely zero noise on the other tank (doing the "turn the key on but don't start the truck" test). I still have a good deal of ignition noise to work out, but the fuel tank noise is gone. I'll install the other filter after I've reduced the ignition noise, as that noise is worse than the fuel tank noise. Note that I haven't listened for the noise at VHF or UHF as I only operate FM there and noise like that isn't a problem.

The part costs $56 from Ford - all for about $5 in parts and plastic molding. It's a rip-off for sure, but then, there isn't much other choice if you want to fix the problem. Labor is estimated by Ford at 2 hours (at $80 locally).

2 things...

I have had terrific success putting the filter in the DC cord at the radio in a Kenwood TM-741, not inside the fuel tank. As you can imagine I can't afford to update all the cars I drive by dropping the tank! However, due to the larger current drain the FT-100 takes I can't guarantee this will work like the 741 does. Of course the filter will do nothing about the horrible ignition noise the Fords make. But I actually have Ford working on this and I will report anything I learn. Last I heard they are pulling vehicles inside an RF room. I demonstrated to a shocked engineer the noise that went well up to 550MHz. He thought there was nothing above 30 and had his eyes opened.

Also, I have repeatedly offered the list members a discount on the white filters, but not one notoriously frugal ham-bone has taken me up on the offer! Oh well.

I'm not the only one on the list that wants to ask, "What did you do to
void the warranty?"

The rig has a one YEAR warranty so what's the problem? I sent mine back
THREE times (the last visit was for a final tune-up and replacing a worn
FUNC button before the warranty expired) and I was NEVER charged a dime.

So, do a Paul Harvey and tell the rest of the story. If there isn't one,
call the CA attorney general's office and get some results.

YIKES!!! A good reminder not to throw your original box away! When mine
went back (in the original box just wrapped in brown paper, Yaesu
shipped it back double boxed with peanuts to protect the original
box. I was impressed by that extra care.

I wasn't too impressed having to send it back in the first place, but
that's a different story...

These units are designed to go with whatever rig you have. In this case
you can get an adapter for the FT100. It comes with a mating plug that has
a phone style plug which plugs right into the mic jack on the front and
another phono plug which plugs right into the speaker jack on the back.
Actually Heil has an adapter with an attenuator built in so you won't blow
out your ears or the earphones. The plug is the 1/4 inch size so you need
to reduce it to a miniplug anyway. Heil has the right cords, plugs,
adapters to make it work easily. And Heil is sold just about anywhere you
can get the FT100's.

4374. [FT100] Yaesu Service & Warranty....

Yahoo group: FT100 (1998 — 2000)

From: Bob Evans
Topic: 4339 Message: 4374

Guys,

I concur that Jeff is holding back a tidbit or two, like: "what size blow torch did I use the last time I fixed(sic) the rig". Jeff has been hammering Yaesu for quite some time and doesn't ever seem to have resolution. Some folks just weren't meant to be FT-100 owners. Jeff...SELL THE RADIO, it's just not for you, bud.

Mine works GREAT!! I'm having a ball with it and the ATAS-100. I'm so glad Yaesu has made my first mobiling installation such a pleasure.

Subject: Re: Yaesu Service & Warranty....

Sounds like way more than we're being told. I have NEVER know Yaesu not to honor their warranty. In fact, I have had a rig fixed "gratis" several months OUT of warranty as a goodwill gesture. Perhaps Jeffrey put his hands in the rig voiding the warranty? Sorry Jeff, your story doesn't make any sense. If you didn't void the warranty by doing something really stupid, then WHY didn't you ask for a customer service supervisor and resolve the issue? Yaesu, perhaps to your surprise, isn't in the buisiness of holding your rig hostage just to get your money. Grow up.

Not only do I have the problem fixed, The radio is on the way back! The paperwork that was TAPED to the rig, somehow got lost and a copy of the receipt was faxed to them. As far as holding back, The Cover has "NEVER" been off the radio, it's in pristeen shape! The paperwork shows the radio to be 8 months old, and it's being shipped back as I type. YES, The radio is already sold (Thank God!).. If ANY of the other Yaesu's need repair, there just getting sold also.. The FT-847 has never been a problem, neither has any of the others. The whole problem stems from the paperwork TAPED to the radio that conveniantly got lost, and now is there.. They lost the paperwork and said they coulden't find me? Well, I sure got notice of the $230 fix?...How'd this happen?......73
I got a IC-706MkIIG and will be here Friday, the FT-100 should be back
Friday also, the FT-100D is at the Seller (who was more than helpful getting the rig returned and sent back to the factory)..The FT-847, as
far as I'm conserned is the best radio I'm using...Jeff

Mr. Swiger is forgetting to mention that the radio was repaired under warranty and shipped back at no charge.

Included with the radio when we received it was a note requesting repair signed with Mr. Swigers nomme de jour. Unfortunately, this note was not accompanied by a sales receipt, and we had no way of knowing the warranty status of his transceiver.
We contacted Mr. Swiger several times, after which he faxed a sales receipt indicating that the rig was within warranty period, which immediate negated the $230 charge.

I hope this clears things up.

73,
Mike Krueger, N6MIK

4379. FT 100 "D" Question/Concern

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-02 18:20:10 UTC
From: Joseph E. Mattern
Topic: 4379 Message: 4379

I would like to hear from the FT 100 D owners regarding any factory defects that they may have found with their radio's as so far.

Have all of the "bugs" been worked out of the FT 100, with the introduction of this newer generation radio?

Several months ago, I purchased my FT 100 and encountered a frustrating experience. My FT 100 would tune up on every band but 10 meters. Aside from that, I loved the radio.

I was considering buying the FT 100 D. One of my reasons for buying this specific radio would be the knowledge/frustration relief in knowing that this radio was "factory defect" free.

Hello Mike, I, and I'm sure many on the list, are wondering if Yaesu will ever offer a upgrade to address some of the improvements desired by the users?
I really enjoy my radio and would love to be able to program memory positions similar to the way my VX5R works.....and alpha tags would be awesome too!
Anything in the works to improve this radio? Thanks,Adam KF7EZ

Sorry, But in my opinion, nobody builds a perfect radio. Some come closer than others. that would be Yaesu at this time.

I had a 706 II and bought a ft-100 D. Big improvement for me, love the rig and I highly recommend it. Some very minor problems, and one i fixed my self.... the tuning knob assembly went loose!!!! I don't seem to have any of the problems the earlier models had. I do think these reflectors can over concentrate on the negatives and not the positives.

Good Luck; we could all use a little!
all the best,

I have mentioned the radio is on it's way back!.. The note you refer
to is a copy of the receipt! It was here I sent the package from..
And
still no mention of the antenna (ATAS-100) that was with the radio?...
But, Yes the radio should be here Friday with or without the antenna,
then we'll see if it was made right the first time..Jeff
I could post or send using any number of names,Etc. you can find me
in
the book! de N8NOE

Geez Jeff Chill out, everyone is still just finding out that you left out some of the information as mentioned in previous posts. And it would be nice if you would cut off some of the rest of the posts that trail your other posts such as the one you left on this one.

4385. memories and extra menu items

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-02 21:44:33 UTC
From: Steve Canney
Topic: 4385 Message: 4385

Hi folks.

As a new owner of the FT-100, I've been having a problem loading up memories. I'm not interested in the QMB, HOM or programmable scan memories, I just want to load up the general memories. I've got a bunch in memory now, but as soon as I try to add another frequency to memory 22, it won't take it! I can only go as far as memory 21. It doesn't give me the option to choose the next memory in line. My understanding is that each group can take 50 memories per channel...what am I doing wrong? I've pushed the SELECT knob to have GCH displayed, but that doesn't make any difference.

Also, I've seen a listing of the functions of the 'extra' menu available when you hold 'A', 'B' 'C' and turn the power on, however, there's no reference to this in the manual at all, and was wondering if there was a place that could properly explain each of these extra functions. I don't want to fiddle with them unless I know what each does. It seems funny these items are a secret to the user unless you discovered them on the Internet or someone tells you about it.

Can anyone help me out?

Steve, VA3SC

Hi All,

I've had the pleasure of dealing with the Yaesu Service
folks twice.

Both times everything went very smothly, and I'm not too
easy to please!

I can NOT say the same thing about Radio Shack or Verizon
Wireless! :-)

I very glad that we have companies like Yaesu that do
stand behind their products.

OK, back in my hole......

Hi Jeff,
I was wondering how the Ft-100 performed for you on 20M, have you any opinions on either 40M or 20M operation with the FT-100?

Wish you better luck with your next new radio as it seems that you have not been very successful with the Yaesu radios.

73,
Bob KA6LSL

P.S. Will I now be reading your comments and complaints on the ICOM remailer?

Steve,

It sounds like you have the memory set to scan ONLY channels that have information stored.

To toggle that feature on or off simply touch the step button while in memory mode. You should hear a single beep and be able to select the empty memories once again.

I am a new FT-100 owner as well and just went through the same thing myself. I knew it was something I had had set and actually remember setting it. I just couldn't remember what I did. It took a couple of trips through the manual for me to find it again.

Can't help with the extra menu functions, sorry.

Good luck,

John - WA8ZGO

Thanks for the tip John. I've got the memories working properly now.

I guess I've always been a Kenwood guy so its taking me a little longer to get use to how Yaesu does things. Frankly, I think Kenwood equipment is a little easier to use than Icom or Yaesu, but unfortunately, Kenwood hasn't come out with a rig like the FT-100 or IC-706MKIIG yet, if ever!

Appreciate the help.

Steve,
Kenwood is coming out with a new radio, no model # as of yet, I think
they said about the end of the year. This radio goes from 160 to 1.2Ghz,
with 2 versions, desktop and mobile, it's a beauty!!! How good is it
going to be? Who knows!!!

Hi Charles.

Yes, I was aware of the possibility of a new Kenwood. If you go to http://www.usol.com/~gdn/new05.jpg you can see a picture of it plus some description. However, my local dealer was speculating that it could be in the $3000 Canadian price range...which would be rather silly of Kenwood to do, considering the hi-end rigs just aren't the big deal anymore. I guess we'll just have to wait and see.

Thanks

Hi Bob!

Glad to hear your 100 is working out so well. I recently picked one up myself, mainly for business trips. Can you tell me a little more about the ATAS? Do you think it could be used by itself, like in a hotel room? Does it need a ground plane?

Thanks and 73!

Hi folks.

As a new owner of the FT-100, I've been having a problem loading up memories.
I'm not interested in the QMB, HOM or programmable scan memories, I just want to
load up the general memories. I've got a bunch in memory now, but as soon as I
try to add another frequency to memory 22, it won't take it! I can only go as
far as memory 21. It doesn't give me the option to choose the next memory in
line. My understanding is that each group can take 50 memories per channel...what am I doing wrong? I've pushed the SELECT knob to have GCH displayed, but that doesn't make any difference.

Hi all!

I've done it twice now - reply to a message on this list, thinking it is going directly to the poster, and notice the 'FT100@egroups.com' address just as I hit the Send button.

I know I can avoid it by paying more attention, but this is the only list I subscribe to that works this way - all the others set the poster as the default reply-to address. To me, this saves bandwidth, and people can then post summaries of the replies they got.

Does anybody else have thoughts on this?

Topic: 4379 Message: 4400

I've only had my -D for a month or so, but it has had no problems at all.
As I understand it, the -D is a stock -100 with the 500Hz filter and TXCO.
The optimist in me thinks this is not a whole new radio, so any bugs
worked out in -100's carry over to the -D. Let's hope!

The -100 might have been a better deal (I could have added the filter
myself) but I've been on the road a lot, I work CW, so I figured I wouldn't
have much time to install it.

I don't find that this list is so active that I have a problem getting through the messages. As well, many people do not post a summary of the replies they get. Lastly, I often find the details of the replying posts to be of interest. I would prefer that the majority of replies to the postings go to the group, rather than the individual.

I'm guessing that the new Kenwood will arrive upon the scene about the same time that the much anticipated Phase 3D sat come on line and proves to be fully operational. This is just a guess but I'm a betting man.

Topic: 4379 Message: 4403

Brian,
I am on a couple of other lists that work this way, and I like it better. It seems to get info to more people, probably avoiding some of the "tell me too" notes, perhaps even saving bandwidth.
But... I dont worry about saving bandwidth. I do recycle trash tho...

BTW, My FT100D mobile is and has worked great. It is driving a Tentec linear, the 420, most of the time. I use a screwdriver and the ATAS via a switch. Of course I dont run the linear into the ATAS as 600W is over the power spec. A/B results on the ATAS vs. a typical screwdriver... ATAS about 12DB down... about 2 S units lower consistently.
See www.ne4s.homestead.com for setup and pics.

Other Yaesu: FT1000MP (used Mobile), FT847 (Also Mobile), FT900, FT2600, VX1R, FTL2100 (Commercial).

I have had a few needs to sent rigs to Yaesu. They have always treated me MORE than fairly. Warranties were allowed a few months past expiration, questionable problems were chased, All specific requests were met. Rigs were returned ahead of posted schedules in all cases.

I have been careful to supply full documents, and pack the rigs well.

I suspect that with any organization, a foul up or two can happen. We are all only human after all. But, I also belive that the vast number of repair actions at Yaesu are routinely well handled. I have no connection with Yaesu....

For what it is worth, re: other people's problems and discussions...
Being an old F**t, one of life's lessons for me is that "attacks will bring up defenses". Duh? Yep, I first learned this in grade school, then spent 50 years figuring it out. I think some squables get out of hand this way. There are several other methods that work better. Negotiation, Explanation, Compromise, Patience, Persistence, and Kindness.

Brian, that last stuff was not directed at you at all, I just got going on this note and wanted to share that message.
I'll probably get several "stuff it" notes, but what the hey.

This is a good list, nice discussions, good info being made public. Good to see a Yaesu response on the list too.

Mike, NE4S

Subject: [FT100] 'Reply-to'

Hi all!

I've done it twice now - reply to a message on this list, thinking it is going directly to the poster, and notice the 'FT100@egroups.com' address just as I hit the Send button.

I know I can avoid it by paying more attention, but this is the only list I subscribe to that works this way - all the others set the poster as the default reply-to address. To me, this saves bandwidth, and people can then post summaries of the replies they got.

Does anybody else have thoughts on this?

-Brian n8wrl

We are all a part of this Lets make it as good as possible.

4404. 2m question

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-03 14:56:48 UTC
From: Will R
Topic: 4379 Message: 4404

I have had my FT-100 (not the D) for about 6 days now. Thanks to the archives of this group we got AM working pretty darn well on 10M. Very happy with my choice until discovering this problem last night.

My friends and I will use 2m FM simplex to talk local, as we move around the bands with our "better rigs". I use a yaesu dual bander for this "local" conservation. When talking to one friend, I have about 2 "S" units on him on the old Yeasu. Last night I switched over to the FT-100 to show him how it sounded on simplex, I called my friend, but could not hear him.
I switched back to the yaesu dual bander, and he said "I here you much better on the FT-100, but I answered you and you can't here me!" I could not here him at all! (no, the squelch was not on)

Where do I start looking through all these menus to "turn up" the receive or see what I maybe doing wrong. I remember reading about a preamp, but it's always turned on on 2M?

Thanks for the ideas in advance!

Several people responded the same way, so with this being an election year
and all, let democracy rule and keep the replies the way they are! :)

I agree - you don't see many companies with that kind of exposure. I own two
Dell computers, and one of the things I really like is the help community
they've set up that tech support staff participates in! Lots of help from
other users as well as the manufacturer.

4406. repair update

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-04 00:06:18 UTC
From: Don DeCaria
Topic: 4406 Message: 4406

I'll give you the short version...had the FT100 hf pwr out go south while on vacation in June...got the rig back in July (less than 3 weeks total turn around, and that because I was on the road and didn't get the message)...
At any rate, the fix to what was broke, on the 9E radio OUT OF WARRANTY was the price of the parts...including parts I had broken myself using my own ten thumbs that didn't keep the radio from working, but that I wanted fixed as long as it was on the rack...namely some ribbon cable connectors that the clips had broken while I was in the process of installing the filters back when I first purchased the radio. Price of the parts:
Thermal switch ohd/35M ft-510 $5.96 (only critical part vis a vis the failure of the hf pwer out)
Connector mx328bl $1.08 (af out jack on the back that had gone intermittent on me, I think it was a broken solder joint but that I couldn't get at easily and was living with until the "big failure".
Connector 12-fmz-bt (X3) $2.22
Connector 20-fmz-bt (X4) $5.04
Connector 16-fmz-bt $1.14
TOTAL to fix the radio: $15.44
Remember: I broke the last 3 listed connectors putting in the filters over a year ago, and while the cable still seated, and the radio worked, I wanted them replaced just to add to my confidence factor.

I did ask for the TCXO-8 unit to be installed as an upgrade for my own purposes...that added another $99 to the bill, for a total of $124.44...
Statement of work performed was:
Replaced all parts as listed
Installed thermal SW and TCXO
Applied all applicable updates
Aligned and tested to factory specs

I consider that very good for a radio out of warranty period AND that had been "violated" by the owner...I made no pretense otherwise...I'm from the school you're not a real ham til the covers off the box...and YAESU seems to understand that...

Oh, yes, the techs and the person who called me with the information were all personable, professional, and a pleasure to deal with...

Bottom line: radio is back, in the car, and giving a very good account of itself on all bands and modes...in better condition than when I bought it I am sure...
Thank you, YEASU! (no, I don't work for them!)
73,
Don

4407. power up

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-04 02:00:00 UTC
From: Steve Canney
Topic: 4407 Message: 4407

Another question from a newcomer to the FT-100.

After finally figuring out the memories and storing about 50 of them last night, when I turned the radio on this morning, the display spelled the word INITIALIZE (in short form) then went into receive mode. Unfortunately, I lost all my memories. Now, when I turned the radio on, I didn't give the power switch a firm push and wondered if this created the problem. Of course, I didn't see anything in the manual indicating this potential problem could happen.

It mentions in the manual that you need to hold the power on switch for about 1/2 second. I guess that was one big 'oops' by me. Who would have thunk it!

Anybody else have this problem? I'm a little hesitant to reload anything into memory considering this frustrating trait of the radio.

Are there any other hidden bugs I can expect to encounter with this rig? Maybe I should have gone the 706MKIIG route!

Steve, VA3SC

Hi Brian,

Yes, the ATAS-100 needs a ground plane. I haven't traveled with it myself, but I've seen an advertisement for a ground plane system for the ATAS-100. I think I saw it on this reflector, actually.

If I was traveling with the ATAS-100, I think I would try ON4UN's theory of a single elevated/slanted radial for your favorite band. For example, it would only take a 17' piece of wire (a 1/4 wave on 20M is approx 17', I think) coming from the ground at the bottom of the ATAS-100 to a point about 5-8 feet higher across the room/balcony/whatever. I use this single slanted radial on a 160M vertical in my home station and it really seems to work. If you don't know of ON4UN, he's a famous low band DXer and has written several books on antennas.

Good luck!

To: Joe, WW4WJD

Joe,

I had one band on my mobile installation (15M) that didn't tune correctly when I first installed the FT-100. By moving the antenna 1" further away from the car body, it started tuning perfectly. Apparently, I had just enough capacitive coupling to give the antenna and my rig a problem. I wasn't sure, from your post, whether you were talking about a fixed or mobile installation, so this may not apply, but you may try a different antenna system or move the mobile antenna a bit (if possible) before you conclude that the rig doesn't work on 10M.

Just a suggestion. Good luck!

Bob, K5WA

I reported "poor hearing" on 2M, asking for help a day or 2 ago.

I could not here guys on the FT-100 that I could on older radios.

The fix was to change the settings in F2 and F5

Without the radio in front of me, I think F5 was the one. I found a
weak repeater, and turned up F5 until it sounded stronger. Actual
it was easy to make it sound much stronger!

Now my friends say my new radio sounds much better then my
older ones, and I can hear much better!

Thanks for the help

I believe what you're adjusted is the 144MHz IF Gain. I turned mine down because I kept getting a 3 to 4 s-unit reading on the meter when the truck is running. Turning the IF Gain up may not be a problem if you live in a rural area but if you live in the city be ready for inter-mod problems from pagers.

Adjusting the 2m rx if gain is not really a cure for a poor rx problem. I have the same problem with my rig and sent it back to Yaseu. They turned the if gain up from 90 to 120. This made the radio appear to work better but it was really no different than turning up the volume. If the rx front end is weak, your noise blanker will not work properly. I put a rx preamp in line in my mobile which compensated for the weak front end and the rig receives normal with the if gain set at 90. The noise blanker also functions normally in this configuration.

I am going to send my rig back to yaseu again and ask them to repair the weak front end. I suggest you do the same.

Steve,
Kenwood is coming out with a new radio, no model # as of yet, I think
they said about the end of the year. This radio goes from 160 to 1.2Ghz,
with 2 versions, desktop and mobile, it's a beauty!!! How good is it
going to be? Who knows!!!

4417. Low tx output on 2m / 70cm ?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-05 23:27:25 UTC
From: Christian Buenger
Topic: 4417 Message: 4417

Hello FT-100 owners..

I have a problem with my new FT-100. It suddenly started refusing to deliver the full power on 2m and 70cm. It just delivers abt. 1 Watt at 145 and abt. 500 mw at 435 ;(. Seems that the transistors are still working. The rig gets warm. Even at that power level. Additionally I can't control the power any more through the menu... SWR of the antenna is perfect (1:1).

Had anybody else had this problem? Any Ideas? I am not very keen on sending the rig to Yaesu....

Shortwave is working perfectly . Full power at all modes...

I have not had the problem. BUT the heat is more then likely from the voltage regulators and the audio amp. What you can do at this point to eliminate a few thins like the antenna swiching net work is check current draw on transmitt if current on tx is close to normal and the back end of the ft100 starts to get warm then the problem may be in the antenna net work, BUT IF ONLYaboout 3 amps then the finals may be gone if they use the output amp for both 2m and 70cm.

hmm... Seems that I have to get a new final amp for the UHF/VHF part...
According to the circuit diagram they use one circuit for HF and one for
uhf/vhf part. The trx draws abt. 2-3 amps when transmitting on 2m or 70cm.

Anyway... Thanks for info...

Been out of town at Region 2 MARS conference, but I
wanted to send my 2 cents worth.

IMO Yaesu is THE RADIO ! so I am bias ! Yaesu service
has always been there for me (Thanks again Mike)
My FT920 got sick with one day left on warranty,
called Yaesu to see if there were any "simple" fixes
but these didn't work. I had to work out of town for
next two weeks, but even after sending rig in aft
2wks, with proper paperwork they fixed rig promptly
and under warranty!
Purchased the VL-1000. Needed info on it. Got Mike the
proper paperwork and he e-mail me the info I needed.
Yaesu is and will be my FIRST choice both for Quality
and Service.

4424. CAT (was CT62)

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-07 00:48:56 UTC
From: Lee Devlin
Topic: 4424 Message: 4424

>hello all...
>iam new on CAT systems
>I just bought the CT62 for my FT 100 can anyone tell me where I can find
>software for it...
>thnx
>OD5PN

Yes, you can find the programs the support the FT100 on the FT100 FAQ at:

http://members.home.net/k0lee/ft100faq.html#cat

The text on that page reads:

The CAT functions require the use of accessory CT62 which is a custom cable
that connects to the ACC pigtail and has a built-in level shifter. The CAT
functions of the FT100 are supported in the following programs:

LogEQF
LOGic (via TRX-Manager)
LogWindow Version 3.07
DX4WIN
Logger
Shacklog
TRX-Manager
TR Log

All of those titles are hotlinked to the appropriate web sites.

Go for the FT-100. I love mine. I use mine for HF mobile, as well as VHF/UHF work. Just got done running the UHF contest as a rover station in northern Wisconsin/Michigan. Had a killer signal.

I have worked EU on 40m using the ATAS-100 antenna.

Bottom line is I like mine, it is working well, and love the compact size.

One that would work is called logger. Just do a search for Logger. It is a free program that offers radio control, PSK31 and of course logging.

Any chance I might be able to squeeze a QSO out of you. Have never contacted OD5 yet!

From: trm martens
Topic: 4427 Message: 4427

Several people have asked how to make the select knob move in 1 kHz steps in the year I have been reading this reflector. The other day I stumbled across a method of how to do this.

1. While in the memory mode, press and hold the step button

until the step changes to 1 k.

2. Go into scan mode, by pressing and holding the up or down

button on top of the mike.

3. Then turn the select knob and you have 1 kHz steps

Hope it worrk for you. Tom VE6TRM

Hi Jerry...

Thanks info... Found out that you can easily connect an Earphone to the
speaker outlet... The output was not too lout. Just had to fix myself the
"stereo" thing... Nothing else... Maybe I was lucky with the earphones ...

These headsets are quite useful for operation... Free hands ;)

73
Christian, DL6KAC

P.S.: Currently major problem with the UHF/VHF amp... No output ;(

From: ham guy
Topic: 4435 Message: 4435

Have used my rig with the atas 100 and am very happy w/ performance.
Going to install a full size screwdriver antenna. Any operation tips?
Shud i build an interface to auto tune the big screw driver or shud i
just manually tune. Is there a way to get the ft100 to tune 80
meters??

Any tips are much appreciated.

Gordon

Hey Fellow FT100'ers

I just got a new 100D and right out of the box there is no power out put on 2M and 70CM. Checked all the power settings & appropriate menu items too. Maybe someone in the QC department will take note and address a possible oversight (?). Anyway, it's going back for a new one. I'll let you know the outcome.

4437. External Speaker

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-09 05:45:08 UTC
From: Dan Baker
Topic: 1330 Message: 4437

Hello all,
I have been using a Radio Shack amplified external speaker with my FT100 and it works well. I have always liked the audio on those RS comm. speakers better then my big M stuff. And the amplified version sounds just as good and makes up for the lack of audio on 2 and 440 FM. My Syntor has a 15 watt audio amp and it does a very nice job. Hey Yaesu Mike, thats on my wish list for the "E" version, a 15 watt audio amp or at least a bigger one. Also a noise blanker that works on 6 FM would be very much appreciated.

73, Dan KM6CQ

I don't think the ATS100 even covers 80m. You might be able to use in on 80 using a tuner but one thing you will learn fast is that the FT100 will not let you transmit on 80 if you tell it you are using a ATS100. Found this out the hard way and had to go back and change the menu setting before I could use a 80m Hustler on my motorhome. Once you set the menu to non ATS it will let you transmit on 80. Just makes it more work to switch antennas.

4444. ATAS usability and rough road

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-10 15:09:17 UTC
From: Jay
Topic: 4444 Message: 4444

Greetings all..

Here in Maine we have quite a few unimproved roads, long dirt driveways, and lets not forget potholes from January until next December.

Having said that a few of us have noticed quite a bit of "play" in the screw section of the ATAS-100 especially when it is used on 40 meters as we drive these roads. (In some cases you could hear the antenna "clicking back and forth" as the van was driving down the road)

On some of these units we have observed that the "play factor" of the extendable antenna when it is used in 40 meters has a direct relationship to the SWR and signal on the band. In some cases you can actually watch the S meter fluctuate up and down about 5 S units on the display as the "screw" part of the antenna moves back and forth.

Upon sliding the boot up on the antenna we have found that there are two metal clip/tab devices that hold ball bearings that looks to form the connection to the "screw" part of the antenna.

Some of the folks here have taken o-rings that and slide them up and over these tabs in the hopes that the elasticity of the o-ring would enhance the compression of the clips and maintain a better connectivity path for the ball bearings. Upon doing this, and then extending the antenna back out to 40 meters, there has been a noticeable decrease in the amount of "play" the antenna has when it is shook back and forth on the diamond mount.

The folks who have done this claim that it has aided in their usage of the antenna on the rougher roads (minimized SWR problems and S unit fluctuation)

However, I wonder if there is a better way of doing this // what do the folks at YAESU have to say about this approach? (Does the added compression increase "drag" on the antenna and cause premature wear? How else could this lack of compression be corrected?)

BTW: Yaesu service folks..
Is there any chance of a ATAS-100-B model that would include 80M?
Yeah, I know that the antenna would have to be a heck of a lot bigger and I am sure some other changes would have to be done. (Firmware to the rig etc..etc..) But let this count as one vote for a possible *new* product.
1 antenna for 3.8 - 449 MHz? That would be something! Let this email stand as 1 vote for it from a die hard FT-100 fan.

I'm glad to see I'm not the only one to have experienced this problem.
When I tried to explain it to the guys here at HRO in San Diego they
thought it was "operator error" or I just thought I was having problems.
On the one I had it got so bad that you couldn't even use the higher
frequencies without hearing signals clicking in and out.

Now I have a newer ATAS-100 and while I never drove off-road with
the previous one (just city street and freeway driving) I retract mine
down to 10 or 6 meters when I know I'm going to be on a bumpy road.

I returned the FC20 and bought the LDG! It is the most awesome tuner I have ever used in 25 years of hamming! I have used in the mobile, portable, and at home. The FC -20 would not even tune my vertical! If you look at the specs, the tuning range for the LDG is much wider than the FC.
I have even tuned random wires with the the LDG that the FC would not even respond to. So my vote goes to LDG!! Good luck but I think you will find this is the popular convention. Adam KF7EZ

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-10 16:23:08 UTC
From: John S. Lehman
Topic: 4449 Message: 4449

Greetings:

I also would be happy to see an ATAS antenna that would cover 75 meters. Most of my HF mobiling is on 75 meters. For many years, I have used the Hustler HF mobile antennas, and they are hard to beat. The Hustler antenna step-up I use is ganging up the 75, 40, 20, 15, and 20 meter resonators on the mast at the same time. The only advantage to a screwdriver type antenna for me would be being able to have more bandwidth, especially on 75 meters. Generally, the Hustler antennas out perform most other HF mobile antennas due to the fact that they are center loaded and the 54" mast below the resonators does more radiating than the coils of most of the other HF base loaded antennas.

I have had my FT-100 for only a couple of weeks, and so far, I am very happy with its performance.

73,

John, K8PJ

Topic: 4328 Message: 4450

I have both tuners.

FC 20 will tune most mobile antennas to give you extra bandwidth. I can use my outbacker outreach on 20 meters to tune 75, 40, 30, 20, 17, 15, 12, 10, and 6 meters. It works good, and is very quiet. This is a good tuner if you want to tune mobile antennas somewhat out of band or to get more bandwidth from your multiband antennas.

the LDG AT11MP will tune just about anything! This one works incredible, but it is very noisy.

Hi Tim. My understanding is that if you only use one ant, Then its ATAS 1 and if you use two ant then it is ATAS 2. I use the ATAS 100 for 6 and HF and a seperate ant for 2 and 440. I use the ATAS 2 setting and it works great...have been using the ATAS 100 for about 2 years first with a FT 847 and now with the FT 100. Mike NH6CJ

4452. FT-100 GROUNDING

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-10 23:10:28 UTC
From: Ed Esders
Topic: 4452 Message: 4452

I have had the FT-100D and the ATAS-100 about a week.
I have discovered that installing a ground strap from the mounting hole on the radio to ground causes RF feedback and itermitant transmit on HF and VHF. Yes I have everything else bonded i.e. engine compartment and hood, Trunk ect. At first I thought the rig was going to take a trip back to the factory but was pleased to find that removing a ground fixed the problem. I know this does not make sense but this is what happed to me.

To Tom (KD4WOV): Please clarify "noisy" which you ascribed to the LDG AT11MP.
Do you mean it causes some sort of hash during its matching process or what ??
Thanks.

4456. RE: [FT100] Tuners

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-11 04:04:48 UTC
From: Tom Tishken KD4WOV(laptop)
Topic: 4441 Message: 4456

It has quite a few relays in it, and when it tunes it makes a bunch of noise(relays clicking in and out). If you installed it under a seat or in the trunk, that should take care of the noise.

The tuner works very very well. Only draw back is the noise.

One other note on both tuners. I just reinstalled my radios (FT-100, FC-20, FT-8100, CD player, several speakers, and a radar detector), and switch positions of my 100 and my 8100. In the new position the mounting bracket did not make direct contact with ground. In the new position (no ground to the case of the radio) It would transmit a carrier on 12, 10 and 6 meter SSB. So I investigated why. I have 3 snap on chokes on the cable next to the antennas, but they don't help with no ground. I tried 3 snap on chokes at the tuner and it took away the problem.

I thought WOW now I should try attacking the ground back to the rig. Guess what, when I attached the ground back to the radio the problems went away!

By the way, Make sure you have a good ground on the FC 20 and it will work like a champ. With out the ground to will only be ok but not as good as it should be. The ground is very very important on any tuner.

I did an experiment tonight with the FC-20, using my 20 meter hustler it would tune 40, 30, 20, and 15 meters no problem, but would not tune 17, 12 or 10.

From: Charles Stampf
Topic: 4328 Message: 4460

I've used both tuners, FC-20 and the LDG AT11. While the FC-20 performed well, the LDG is outstanding. The clicking relays are only noisey during tune-up. It is fast and appears to have a wider tuning range. The dual antenna feature of the FC-20 is handy, but I'll take the LDG anytime.

==========
Dear Mr. Mitchelson:

Thank you for visiting the Subaru Web site!

We generally don't recommend transmitting devices be installed in our vehicles because they could cause interference, and should you have a security system the radio may cause it to set off. This being said, we have heard from some Subaru owners who successfully have used their amateur radios in our vehicles. If you decide to do so, we suggest that you have it properly mounted as far as possible from the Electronic Control System, and that you take all the necessary precautions to eliminate interference.

Also, please note, any etching on the glass can weaking the intergrity of the rear window. There is a UV rating, but no tint is on the glass.

For further assistance, you may contact your Subaru Service Manager for assistance. I hope this information is helpful, and thank you for taking the time to contact us.

Pam Federer
Subaru of America, Inc.

Although I am sure that Subaru's legal department had a great deal to do with the type of response that you received, RF interference from VHF bands into modern vehicle computers is a real issue.

Those of you weak signal buffs may remember last year when some of the folks up here in New England (NEWS group members) found out the hard way that their 222 CW and SSB transmissions played hell with their on board computer, especially the circuits that controlled the cruise control...

No accidents, but it was an "lively" situation for a while...

Hi Tim.
I guess I'm responding to the "should" part of your posting. The -1 or -2 setting makes no difference in the rf (tx/rx) workings of the radio (altho 80/160m tx is locked out in both). The difference is only in how the motor logic works. In ATAS-1 (for "one antenna"), if you're on e.g. 2m, pressing TUN makes it go into a timed retract cycle without transmitting. In ATAS-2 ("2-antennas"), TUN on 2m doesn't do anything. I have mine in ATAS-1 but use separate antennas -- it just makes it easy to retract it.

4466. The car has beat me.....

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-11 15:25:07 UTC
From: brian.woodbury@sabicusa.com
Topic: 4466 Message: 4466

I eagerly installed my ft-100 (which was working fine in my mini-van) into a 1999 Lumina. The install went fairly well (http://www.cbgazette.com/ft100_lumina.html) and I was able to check in on a 10m net that evening while sitting in the driveway. The next morning was another matter- VHF was fine but 10m had the SWR icon "on" and apparently a squeal or something else on transmit (dead-key would show 50watt carrier). The unusual aspect of this was that after about 15minutes of driving, this SWR/RF problem would disappear.

Going home that evening I had no problems and when I got home I inserted an SWR meter in-line. The next morning I got in the car and briefly keyed the mike on 10m and it was fine. Started the car and accidently keyed the mike when I set it down and BAM, there was the high swr/carrier. Turned the car off, and back to normal. As I indicated on my install page (link above)I cheated on the ground and used one inside, and under the dash. I removed this ground and ran one straight to the frame/starter ground.

The problem went away for the most part (occasionally the SWR icon would flash "ON" but no transmit problems) for a couple days, but returned on the 3rd day.

Went to EPO (electronic parts outlet) in Houston and bought some ferrite cores and put them on the negative and positive power leads, VHF and HF coaxial leads, with no noticable change (left them on anyways).

Took the SWR meter out of line and the problem was vastly reduced again - for a couple days, then returned this Monday morning.

I took the antenna off the trunklip mount and put it on a large magnet mount and the problem went away all day Monday, Tuesday, Wednesday, but returned Thursday morning (once again, only when the car is running).

I've hooked up the FT-100 in the mini-van briefly and it seemed to work as well as before. I also have a CB in the car and works fine....but it seems that the Lumina and FT-100 don't like each other very well. So, before I sell this rig (which otherwise I really like) maybe someone can suggest something I missed!

It sure seems that there is some feeback problem in the system, but I don't understand why it will go away when I change something, only to return 2 or 3 days later, and also, why it seems to go away on it's own after 15 minutes or so...Thanks for reading!

I only have a 10m "stick" and a dual-band (vhf-uhf) antenna on the car now, with no tuning involved. I can go from HF to VHF and VHF alwasy works fine. If I go back to 10m, the swr icon with carrier/feedback (I haven't borrowed another rig to hear what it sounds like)on a "dead key", is still there.

I've been licensed as a Tech since 1986 and just received my General. I'm considering the FT-100 (I've been a longtime Yaesu user having had a few HT's, presently the FT-51) to get into HF. I'm interested in knowing why you all chose the FT-100 over the ICOM IC-706 or the other rigs (which don't have the VHF/UHF) such as the Alinco or Kenwood?

I'd like to put the rig in my car, which is a 1999 Honda Civic. Seems to me there is enough room for the control head, that shouldn't be a problem. My main concern is what antenna to go with. The ATAS-100 is a bit pricey, but it does cover everything, or just about everything. Would I still need an antenna tuner or does this antenna incorporate that function? What about something such as an Outbacker? I guess that's almost the same price, isn't it? Would monoband "hamstick"-type whips be the way to go? I'm no "techie" so I'd be very interested in the input from this group.

Thank you in advance.

I own the FT-100 and the FT-847 and have had no problems out of either except for a slight grounding problem (which I caused) on the mount for the ATAS-100. I used ot own an Icom 706 and found that the menu system was easier to operate for me while mobile. I also like the DCS and ARTS that Yaesu has in their units. My wife works at a hospital and in the Winter it is a cold wait on my way to pick her up. This way without have to stand outside to "see" me pull in she can wait inside till her HT beeps and she knows I am in the parking lot. Also I am active in CAP and found that the 706 would not do the 4.5 meg split for the VHF repeater (later forrected in the MKII and MKIIG models) also I found that the IC-706 lacked a direct screwdriver tuning interface. I personally wanted ease of operations. Just some of my reasons.

I have mine installed in my 2000 Tracker and it works like a champ. I have remoted the head to the front of the ashtray. The ATAS-100 offers some convienence over say the Outbacker (which is incidentally the antenna I used with the IC-706) - I did not like having to get out to change the banana plug to switch bands and I would probably find the same issue with separate whips. Depending on how serious you plan to be on the air mobile should be the real factor in your antenna selection. I think that Monosticks are probably the best performing, but you lose the convience of switching from band to band in motion (okay granted you can gang Hustlers but on a Honda heheh?) If you want to make some good contacts while mobile and enjoy casual operations I would recommend the ATAS-100 - I have worked alot of DX from the truck and while I might not beable to fight the big pile ups it still

performs well enough for me.

Mark,

My choice for the FT-100 over the 706 were as follows:

The 706 display has a tendency to turn black when exposed to
the heat inside the car during the day (they may have fixed that
with the 706G but I don't know).

The FT-100 has a much better noise blanker than the 706 and
this was even mentioned in the QST review.

Now that I own a 706 (for home use) I've found that the menu
settings and memory programming aren't as intuitive on the 706
as they are on the FT-100. I find it's much easier to navigate
around the various settings for the FT-100 than it is for the
706.

Now for the antenna part...

I started out purchasing the FC-20 tuner for the FT-100 and tried
using it with a 102" fiberglass whip. The tuner would tune the antenna
to 20 meters and up but that was it since it's not really designed to
work in a mobile application.

I thought about the Outbacker but decided that I was too lazy to
pull over each time I wanted to switch bands so I went with the
ATAS-100. With this antenna, no tuner is necessary. If mounted
and grounded well you should be able to get all bands between
40 meters and 70cm, however, the antenna does not cover 80 meters
and it's not recommended for VHF/UHF use as far as gain is
concerned, for some this isn't an issue.

Hope this helps some.

Brian,
check the RF/Squelch setting. I have forgotten to reset it for RF after being on VHF/UHF. For the SWR, get it all grounded, see the other notes here on the topic... and as a last resort...
Try adding or taking away 3 or 4 feet of coax in the hf feed line.
Sometimes the length ends up a multiple of 1/4 waves and can cause trouble.
I have seen this fix some ODD things...

Good Luck,
Mike, NE4S

I only have a 10m "stick" and a dual-band (vhf-uhf) antenna on the car now, with no tuning involved. I can go from HF to VHF and VHF alwasy works fine. If I go back to 10m, the swr icon with carrier/feedback (I haven't borrowed another rig to hear what it sounds like)on a "dead key", is still there.

We are all a part of this Lets make it as good as possible.

Greetings:

As I had indicated in an e-mail before, the Hustler HF antennas are probably the best antennas for the money. Been using them for years and I have no major complaints.

Hi Folks -

As you may remember, my 2 month old FT-100 went back to Yaesu on 7/18/00 and today I got a yellow postcard from the service dept. telling me that they are now experiencing 2-week turnarounds with a number to call for information on the repairs to my radio. Well, that sounded promising as the unit has been there over 3-weeks! I called them today and a gal there tells me that the tech working on my rig has confirmed the problem (popping sounds when returning from TX to RX) BUT is waiting for information from Japan! I couldn't drag anything else out of her and she wouldn't let me talk with the bench tech working on my radio. She suggested I give them another week. That will make it a whole month and by then they may still be waiting for "information" from Japan! The bright side of the matter is that I wasn't just imagining the loud squelch-like popping sounds, but the downside is that Yaesu couldn't give me a time frame as to when they could expect the information from Yaesu. At this time I don't know if they know how to fix the problem or not. It doesn't matter, I guess, because I am not getting my radio back anyway until they fix it or replace it. Okay, none venting... Tnx for listening.

Hi Jay.
I've done a bit of work on the innards of my ATAS-100. Mine developed some problems from corrosion (due to my own violation of the seal), including intermittent contact between the ball-bearing contacts and the coil winding. I burnished the coil and treated the contacts with cramolin red. I also added a little more bend, upping the force of the leaf springs. Things have been solid for many months now. I have wondered if the contact problem was all my doing or if it could develop under more "normal" circumstances.

I get the high swr icon when transmitting on two meters (160 watt amp & HO loop) the antennas are quite close, when I move the HO loop 6-8 ft away the icon also goes away. As I understand, the SWR meter does not operate on the high bands, aparently the Icon does tho. Are both your 10 & Vhf connected to the FT100? May be feedback from one to another. Do you get this senario with only one antenna attached?

Hi Dave,

I get this problem with both antennas, or just the HF (and vhf
disconnected)plugged in. And, as a rule, I can make the problem go
away by merely turning the ignition "off".

Tnx
Woody

I run the ATAS on a tractor trailer rig mounted behind the sleeper. I have to pull mine down at regular intervals and clean the insides. With the wind vortex around the tractor and the bouncing, it takes a beating. I clean the coil with a special cloth I got that is not too abrasive. I also put some RTV over all the screws and around all the places that water can get in. It helps, but some still managers to get inside. I have not noticed any fluctuation in SWR while transmitting on rough roads. I have grounded the antenna base with heavy copper wire to the frame of the truck. I get good SWR on all bands, however, I can not use 40m with the truck running. It gets into the engine computer system and also the satellite system. Not sure why. If the truck is not running, it is fine. I also have a mount and have hamstick antennas for 6, 10, 15 20,40 and 75. I use these also. I run a separate antenna for 2m/70cm. I have had good luck with everything associated with the radio. It subject to severe heat and cold, rough ride and other sorts of abuse that a regular mobile rig does not get. It just keeps on working, at least so far.

Just received my FT100 back last week after sending it for warranty repair back in June for the famous 10m oscillation problem. Took over two months due to UPS shipping damage on the return trip as a result of Yaesu's poor packaging on the first attempt to return it. To Yaesu's (and UPS insurance!) credit, the control head was replaced because of damage due to severe force being subjected to the front of the radio.

I re-installed it into my Cherokee, which used a hole-mount Larsen 2/70 antenna for VHF/UHF, and a hole-mount Wilson 1000 for 10m (both on the roof, about 36 inches apart).

The oscillation problem still occurs, even with the VHF/UHF antenna disconnected from the radio. The 10m antenna SWR is <1.2 to 1. I can unkey and key the radio multiple times with no effect, but if I tap the top rear of the radio firmly with my hand, the oscillation stops and the rig will work fine for awhile. Leave the radio off for awhile and try again, same scenario.

Even more aggravating is the fact that the Yaesu service invoice states "performed applicable updates", no parts or description of worked performed.. A call to their telephone number also leaves my question as to what exactly was done still unanswered. Meanwhile, my radio performs the same way as it did before. I am going to call Yaesu one more time Monday. We'll see how it goes.......

Wish I bought another 706! (still have my original 706 mk1 - no problems yet!)

Percussive Maintenance!

Sounds like it's time to open it up and run some good
RF grounds to the Low Pass Filter and Power Amplifier
sections. I have sent my rig into Yaesu once as well,
and they were unable to duplicate or cure the problem.
At least they were prompt and courteous. But I want the
problem fixed!

This week I was experimenting with a mag-mount dualband
VHF/UHF whip on the roof of my car and the ATAS-100 on
the trunk lip (therefore no duplexor.) The coax for
the dualband whip was routed into the trunk near the
ATAS-100. On every ham band between 18 MHz and 30 MHz,
I consistently saw both 80 watts output during tune mode,
and inability to reach low SWR. I haven't verified that
this is from parasitic oscillation yet, but it will be a
simple matter to duplicate it for anyone with a freq
counter or spectrum analyzer. (What else would cause
80 watts during tune mode or dead key on SSB?)

Later on, in disgust, I went back to my original setup,
and now I have zero problems on all bands. I am using
a duplexor to combine the 2 antenna outputs to the ATAS-100.
The ATAS-100 is mounted on a Diamond trunk lip mount.
I have used the metal doughnut from an ATBK radial kit
to attach a stout braid from the ATAS-100 to the trunk lid,
and from there to the car body. There is also a Diamond
super-gainer on the opposite side of the trunk lid.
My little Honda Civic looks like a grasshopper :-).

This is one unstable radio! It breaks into oscillation
much too easily. I guess that RF energy entering the VHF
port might have something to do with the oscillation, but
apparently it can even oscillate with nothing attached

to the VHF port (see the quoted message above.)

I will probably try adding a better ground connection to the power amplifier and low pass filter modules next weekend when I have more time. I was just going to crank up the CW sidetone level, but apparently I'll get to do some soldering as well. Perhaps filtering the power supply leads would help? I have a 20 amp alternator whine filter that I can try.

Meanwhile, until Yaesu can solve this problem, I am unable to recommend this radio to anyone. An unstable power amplifier is an unacceptable bug.

Best Regards,
John KJ9U <john@...>

I think that at one time, the grounding straps on the internal coax connections were done with copper tape and that is not a consistent long term solution. The conductive adhesive loses its conductivity over time. We use the stuff all the time in experimenting with RFI problems where I work and it's a good troubleshooting tool, but we generally don't ship a product with it because it's not a consistent, long term fix.

I had the intermittent SWR problem and I regret that I did not do a 'before and after' picture of the inside of the rig. When it came back, I opened it up and scanned it on my scanner. You can see the way Yaesu did the mod at: http://members.home.net/k0lee/factorymod.htm The grounding straps are connected to the casting with tiny screws.

The pictures are different than the ones I found on the FT100 files that have the copper tape on the casting where the straps attach. You can see those at:
http://www.egroups.com/files/FT100/FT100+Inside/

As for Eric's problem, where pressing on top of the cover makes a difference, it's likely that the continuity of the copper tape is being affected by movement of the cover.

I also noticed a number of strategically placed pieces of copper tape on the inside of the radio's cover, presumably to assure better continuity of the cover to the chassis. Also, the screws that secure the cover have a black oxide coating and the holes they are in also are painted. In my own experience in dealing with RFI problems, this approach does not guarantee a good RF connection so the copper tape may be to compensate for the lack of continuity through the cover's mounting screws.

super-gainer on the opposite side of the trunk lid.
My little Honda Civic looks like a grasshopper :-).

This is one unstable radio! It breaks into oscillation
much too easily. I guess that RF energy entering the VHF
port might have something to do with the oscillation, but
apparently it can even oscillate with nothing attached
to the VHF port (see the quoted message above.)

I will probably try adding a better ground connection
to the power amplifier and low pass filter modules next
weekend when I have more time. I was just going to
crank up the CW sidetone level, but apparently I'll
get to do some soldering as well. Perhaps filtering
the power supply leads would help? I have a 20 amp
alternator whine filter that I can try.

Meanwhile, until Yaesu can solve this problem, I am
unable to recommend this radio to anyone. An unstable

power amplifier is an unacceptable bug.

S-Meter in general seems not as active as other rigs, most bands. Try to compare sensitivity on a weak signal without watching s-meter. (ears)

Thanks for the great information, Lee! Now I know where to ground it.
(Or at least a good place to start.)

I sent the rig into Yaesu for the anti-oscillation mod a few months ago,
so it will be interesting to see whether my rig has this mod already.
If not, it will receive the mod in a very short period of time :-).

You can adjust the S-meter sensitivity if you want...
I like the S-meter just the way it is, though. Most FM rigs
saturate the S-meter reading at a very low signal level.

One of the nice things about the FT100 is the way the
receiver rejects pagers and other commercial stuff on
VHF and UHF. I had to put 4-cavity helical resonators
on my Kenwood TM-V7A to get similar performance. Impressive!

John / Dave / Adam,

Let's put it this way. On an HT inside, the repeater is full scale and clear. On the outside antenna with HT still full scale as would be expected. Putting the 100 on line and the repeater shows no bars and a slight hiss as if there is an attenuator in line. I can't believe for one minute that this is correct. 2 meters works fine, the meter is a little weak, but not like 70cm. Somewhere along the line there was a message on the reflector referring to the front end sensitivity being off. Maybe this is the problem (?) .

From the FAQ:

Repeater Offsets

The repeater offsets are determined by the values set in menu items 40-43.
If you need to program a memory that has a non-standard offset, use the DUP
memories since the repeater offset is not stored with the other parameters
in the standard memory locations (1-300).

Sorry for sending previous message with read receipt. Had been doing some other business and forgot to take it off in the post.

Recently bought an MFJ antenna analyzer and have been doing some experiments with the ATAS 100. On the 10, 15, 20 and 40M bands it appears that the antenna is tuning with the roller contacts on a less closely spaced winding of the coil. On the other HF bands it is in a tighter area of the windings. Not positive, but it seems this is why some find it much more difficult to get a good SWR on these bands. On all freqs I checked I could get a good SWR, but outside 10, 15, 20 or 40 it was more difficult and required a bit more exact tuning to achieve the lowest reading. I have modified my ATAS to use a remote tuner contol box. I use the analyzer to pretune the antenna then switch to the FT-100 and make no further adjustments. This works well for me, but I must admit that it is a bit slower. I am investigatin some other antennas for use on the "big truck". The ATAS is a bit heavy and where it is mounted requires constant attention to prevent metal stress from the constant vibration.

Will look for the net Sunday as I will be traveling somewhere in California or Arizona most of the day.

Good QSOs to all

Yes, I took mine apart when it quick working. It appears to have #22 wire closely wound except for 40 meters and then again at 20 meters. The coil form appears to be 3/4 inch fiberglass. There are four ball bearings held in place with two screws and two spring clips. The motor is about the size of a thumb nail and there is an attached gear head. Using the ARRL program to calculate efficiency on 40 meters gives less than 5%. I'll recalculate that when I have time. I can provide pictures of the pieces.

I think there are some lousy front ends on the UHFand/or UHF rx. My 2m is very poor on rx. Yaseu techs compensated by increasing the 2m IF gain. This did no more than turning up the volume. As we know the volume has nothing to do with s/n ratio. I put an external preamp on my rig in the car and noticed a significant improvement. I reduced the IF gain and the unit works OK with the preamp. But why should we have to depend on the external preamp? My FT-847, IC-820 and IC-706 in the same vehicle with the same antennas do not need the preamp.

hmmm my Ft-100D has a stingy S meter but I have worked many stations fm simplex out to 150 to 200 miles on FM using a diamond sg 7900 and a mirage running 150 watts on 2 meters and 100 watts on 440 mHz. The Ft-100d actually does better than my FT-8100, because it will talk further and hear better than my 8100. the 100 will actually hear stations that my 8100 does not even know that they are there.

I have weaker S-meter reading as well. I guess its due to the way
Yaesu calibrated the S-meter in the FT-100. I have a 2m repeater
about 1 mile from my house and the most the FT-100's S-meter
will display for a signal is S9+40. I've even had a friend sit in my
driveway running 50 watts on 2m and the FT-100 doesn't won't
show S9+60.

the industry at one time had a some what standard of 100 UV for a S9, then
there was an attempt to bring it to 50 UV for a S9 but as for as I know
at this time whit out doing a lot of reach the 100uv for a S9 is valid and
I am using that today on alignments when a radio has a s-meter.
The increase volume normally doesn't come when you increase the if gain
unless you are using AM mode of TX and rec.

Yaesu s-meter alignment is somewhat broad: they set the FT-100 up on USB at
14.2000 MHZ and inject +95dbu and adjust menu item f-07 for a reading of
S9+60db on the radio. Now how acrate this will be across the designed bands
of the FT-100, I would have to do a complete bench mark of the radio.
Hop this is of some help

Topic: 4480 Message: 4501

Everyone keep in mind that the S-Meter on the FT-100 reads real received signal level on FM, unlike most FM transceivers. While the S-Meter on most FM tranceivers will pin at modest signal levels, it will really take some 60db above S9 to pin the meter on an FT-100.
For reference, I put a new FT-100 I receintly bought for my boat on my service monitor and took some readings.

S9 +60
uv dbm uv dbm

146.520 FM 110 -66 20,000 -20.9
14.250 SSB 125 -65 19,900 -21

OK, so it actually takes some 45db above S9 to bring on the +60db LCD element on my radio. Still 20,000 uv is a LOT of signal. That's .02 volts of signal at the input of the radio. For reference, I had to get my HT within about 10 ft of a 1/4 wave whip on the service monitor to get the same level. So, when you're driving around with your FT-100 and you see S9+60 on your meter, look in your rear-view mirror.
Note also that the measurements are essentially the same between 2 Meter FM and 20 Meter SSB.
I think it's a real plus that the FT-100 S-meter works this way and I don't suggest anyone making any adjustments to it unless you have something specific in mind.

My FT-100 would read S-8 when sitting ay the base of the repeater tower. You folks can rationalize all you want to but he cottonpicking S meter is too stingy. After I adjusted the S-meter to read full scale from the repeater, it now reads S-4 with no signal.

Comments made by me earlier about the VHF receive being lousy concerned the weak signal modes and not FM. I tuned the unit to 144.000 MHz and found a dramatic increase in sensitivity. Anybody know how to change the peak sensitivity from 144.000 to 144.200?

Sitting right in the null of the pattern -- that's probably about right.

> After I adjusted the S-meter to read full scale from the repeater, it
> now reads S-4 with no signal.

Yep David, I guess you got what you asked for. If it makes you feel better to have all those little LCD segments turn on, then sure, go for it. Don't, however, accuse the "cottonpicking S meter" of being "too stingy". It's doing exactly what it was designed to do. Well, at least it WAS.

Hi Lee -
I think the additional groundstrap to the shield on the main unit is new info. That shield is in the area of the hf tx amplifiers that go off and feed the PA. So I have just now gone ahead and added it here, altho I have not had any problems after making sure the connections to the casting rib were solid (gave up on the tape and put in a screw a few months ago).

Chuck,

No, we were not in the null, numerous tests were made from various positions.

No, I did not get what I asked for. I asked for a rig that would function properly.

There has been numerous posts since the FT-100 was introduced concerning the stingy S-meter. I don't think we are all poor ignorant operators. Its just hard for me to accept that the FT-100 has the only properly designed S-meter and all the others are toys.

Most S-meter circuits have two main adjustments, a zero adjust and a S-9 adjust. I assume the menu adjustment is the S-9 adjust. Has anyone found the zero adjust?

Sitting UNDER the repeater would be a bad place for maximum signal. As that would be a null of the antenna.

Well well.... perhaps it is the FT-100 that is correct??? And how do you know you were not in a null???

The rig you have is just fine. You are talking about an S meter... basically that has been quite relative on all radios.

The bottom line is.. can you hear the signal? if you can, how important is the level on a meter??

Guess there is no pleasing everybody.

If you're sitting at the base of the repeater tower (your words) and you have any kind of normal antenna, you're in a null in the pattern. If you're not in a null, the repeater is wasting power, you need to find a different antenna for the repeater.

Basically, that's the case. Since S-Meter circuits generally operate by sampling the level of signal somewhere in the IF, and since FM IF's are intentionally not designed to be linear, an FM only radio would have to have a separate IF for the S-Meter to give accurate measurement of the received signal. Since that's an extra cost, most FM tranceivers do the S-Meter sampling from the FM IF and therefore saturate with relatively little signal. While I haven't looked into how the FT-100 samples the signal level, it's clear that it's getting a signal that's truely relative to the received signal strength and that's what it's displaying.
I certainly wouldn't consider anyone on the list to be a "poor ignorant operator" (again, your words). All I'm saying is that people who are used to running FM transceivers on the local repeaters should not expect the same kind of S-Meter readings on the FT-100 as they're used to. This is not a failing of the radio. On the contrary, it's a strength of the radio, but likely disconcerting to some operators.

> Most S-meter circuits have two main adjustments, a zero adjust and a S-9
> adjust. I assume the menu adjustment is the S-9 adjust. Has anyone found
> the zero adjust?

There's likely an adjustment for the S-Meter origin level. However, since you're adjusting all this to suit your tastes, don't expect to compare these levels to any other FT-100's, or for that matter with other radios. Also, since you want to see S9+60 with a "strong local signal" and seem intent on setting your radio to do this, you shouldn't be surprised to find that signals that are S-9 on most FM transceivers will now be well higher than that on your "adjusted" radio. Hopefully, that won't bother

you too much.

Chuck,

You seem to feel that the S-meter circuit in the FT-100 is properly designed. Why did Yaseu pick this model and not some of their others such as the FT_847 or FT-1000 to use this much improved circuitry?

With the properly adjusted FT-100, would there be any operating condition where one could observe a signal above S-8?

The S-meter stinginess is not limited to FM mode. 99% of my operation is on 2m SSB. I notice similar problems there also.

This is becoming troll like. David if you are not happy RETURN THE RADIO and leave the rest of us that are happy with the radio alone.

In the last UHF contest I had a station that was about 250 miles from that was 10db over on 432.

I for one am glad that this radio seems to show a more true reading of the S meter!

Kent, K9EZ

PS - I operate HF mobile Dx, 6M SSB/CW, 2M SSB/CW, 432 SSB/CW. I rove and run mobile.

I seem to recall that QST even stated that the s-meter on the FT-100 was
"stingy" but the reviewer went on to say that it was really a more accurate
indication as to what the true reading of the signal was and that any dual-band
mobile's s-meter is set high. As for the sensitivity issue... I'll have to
continue
playing around with the radios to see which hears better between the three
radios I have that can do VHF (FT-100, IC-706 or IC-2100).

John,

I had exactly the same problem until I discovered that the commercial mount I had purchased didn't have the coax shield soldered to the antenna mount. Solder the coax to the mount and I'll bet you can recommend Yaesu all day long. It amazing how well these radios work if you actually hook an antenna to them!

I do have a FT-847 and it is usually a few 2 units within what my FT-100D reads. I don't know what kind of signal meter your HT has but you need to check your calibration on the meter. look at Field strength reading and signal insertion levels to determine if your s meter is close.

I have to agree with previous post that the meter on the FT-100D (and my FT-847) are closer to being accurate than other rigs. Comparing a FM rig to an ALL mode is like comparing a cheap CB to a $20,000 Watkins/Johnson or another High end HF receiver. both will receive 27 mHz but circuits are totally different with BIG differences in performance!!!!!!

David:
What makes you think the FT-100 is any different than the FT-847 or
FT-1000 in this way? Unless you have a radio that has some kind of
problem, the S-Meter should be responding acording to design.
If you read my earlier message, you would know that the radio I tested
last night read essentially the same thing for the same input signal level
regardless of the mode, which is of course as it should be.
In answer to your question as to whether a properly adjusted FT-100
would observe a signal above S-8, the answer is yes. 100 uv, or there
abouts, will get you an S-9. Those levels aren't too unusual in normal
operation. A +60 however is very unusual and you should hardly ever expect
to see that.
In any case, it's unfair to criticize a radio based on some subjective
evaluation of what you "think" it should be doing. I suggest that you set
it back to the way it was and find someone with a service monitor to check
it out and see if it meets spec. If you're not willing to do that, then
don't keep questioning what I'm telling you.
On the other hand, if you just want to see that meter jump without
regard for what it means then perhaps you shouldn't have an FT-100.

(End of thread.)

Having read the other related post (intermittent oscillations) I think that they may have something in thinking the adhesive copper straps aren't always making the best ground. This morning it was very humid (quite often this is when the problem arises) and when I got in the car I jumped down to 10m and the swr icon flickered "on", then "off". Taking a cue from another poster I wrapped on the case of the rig with my knuckles and keyed the mike to see that it was recording a full scale transmission on SSB with no audio into the microphone (my intermittent problem). I squeezed the case (at the rear of the unit) and keyed again, and the problem was gone. More later...

Yes, Ldg will not do 6 meters the FC-20 will do 6 meters. FC-20 has two antenna jacks(A and B) LDG does not.
LDG is a Great tuner, but mine will not tune on 6 meters(they are only rated to 30 mHz).

If you not going to need a tuner on 6 Meters go for the LDG.

sorry about the last post I thought you were talking about the FC-20 vs. LDG.

I have the AT11MP and really electrically the at11 is the same just no meter. I got the one with the meter, because I use it some times with my FT-757GX and it don't have a SWR meter. Also the meter makes it a lot easier to tune it manually.

4529. major Ignition noise problem with GMC truck HELP!

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-15 21:53:42 UTC
From: John Simmons
Topic: 4529 Message: 4529

Hello to all
I just purchased a 96 GMC Sonoma with the 4.3L V6 engine. I have been working on getting the FT-100 installed the last few days and was checking out the trucks AM radio. I have notice that there is quite a bit of ignition noise on AM broadcast. The noise seems mild when the cruse control is on and the vechile is not accelerating. Under light acceleration there is some popping but not a steady racket. Under hard acceleration there is a steady popping that increases with engine speed. Also there is some distortion on the AM signal. With the ignition switch on accessory the noise is completely gone and there in no distortion. I have talked with the GMC dealer and the said they would look into whether there were any service bulletins. I feel that there is major ignition noise problem and it will only get worse when I get the FT-100 installed.

Help
Has any had anyone had any experience with GMC or Chevy trucks.
This thing has electronic controls for fuel injection , transmission and the engine ignition. I am at a loss as where to start looking.
I am planing to ground everything in sight other than that I don't know how to solve the Ignition noise.
Any suggestions would be welcomed.

I had the same problem with a 1996 GMC Jimmy, same engine. A DX70TH was all but useless, even a TimeWave59+ didn't help. Got the FT100 and found an IF noise blanker that really works! Major problem I have had has been the hi-swr symbol occurring on HF. Cured by toroids and ferrite rings on every cable entering the base unit, especially the cable from the control head. Also installed a Radio Works T4 line isolator in the HF antenna line at the radio. Final kink that made the above work was a very short ground braid from radio mounting bolt to truck body. Radio is mounted on the left door post between driver seat and rear seat.

Antenna is hamstick and four-magnet mount. Don't ground the antenna assembly, swr will rise. Hope all this helps. I have heard the 706 noise blanker is almost as bad as the DX70TH. And in a review of the 756PRO they found at W1AW that it's noise blanker sounded just like the 706! Go figure.

Your in luck.
I have a 97 GMC Van with the same engine. It also causes ignition noise on weaker AM broadcast stations, however, the FT-100 noise blanker will completely remove all of it. The ignition noise is S-9 on 40 through 10 meters without the noise blanker.
If you find a cure for the ignition noise, please let me know as I sometimes like to listen to those weaker AM broadcast stations when the bands are dead.

Dave, K8AA

Dave
I may have found a solution at the following web sight.
http://www.magnecor.com/magnecor1/CN25.HTM
They sell wire designed with ham operator in mind.
thanks for the reply

Hello to all
After doing a little research on the web I was able to come up with suppressers wire that sounds promising .
I was wondering if any had ever used any of the CN series wire from Magnecor.
My thoughts are if I can kill the noise before it gets to the radio I can hear more .
In any case if any one is interested the specifications are at the following web sight.

I used the KV-85 on my V-8 Landrover and icom 706. Worked like Magic!
Don't need them for the FT-100 because the NB is far superior to the 706.

Electrically short antennas will have a very low impedance at resonance.
A 50 ohm dummy load has a flat SWR. What you are seeing is a higher
resistance to ground (like a dummy load), which helps make the antenna
look like a higher impedance. But more of your signal is now a
footwarmer for stray birds. It is far better to ground the antenna
mount and deal with the SWR some other way, like an impedance matching
network right at the antenna.

Try checking the field strength with and without grounding, and you'll
find that the better ground at the base of the antenna will give a
stronger signal.

My 1990 Mitsubishi Montero began severe ignition interference several years ago. The purchase of a good set of NAPA wires and other ignition components helped some. I could not resist the ad about the Magnecor CN wires and tried them. They were no better than the NAPA wires. My experience has been that the original equipment wires and other ignition components offer the best service.

I agree that the NB works well (I have a 95 Blazer).

In a non-FT-100 response... try looking at the antenna connection by the wire wall. I have found that that connection MAY have a bad plug, as the male plug pulled out from the cable. I just pushed the wire into the female plug and surprise..no noise!

Is anyone using an Amp with the FT100? Followed the instructions in
manual,
just send and ground no ALC. Would not key Amp, is manual wrong or does
Radio
need to go to Yaesu for repair? Could someone please explain how to
hook up Amp no ALC just straight to send relay. Amp is Dentron MLA-2500
manual was no help.

Thank You,

Christy Chisholm

From: John Walker
Topic: 4545 Message: 4545

The manual is correct. On mine an SB1000 it needs an alc rca led and ptt. I use the setup in the manual that has a 1/8" stereo plug Y out to two rca male jacks which go to
the alc and ptt ckts in my amp. It works fine, no problems with many hours of use.
I am not sure how you Dentron is set up. You may need to use different jacks depending on you amps plugs and requirements but note the inner and outer contacts for the 1/8" plug and you should be fine. If you have any questions let me
know.

Subject: [FT100] HF Amp

Is anyone using an Amp with the FT100? Followed the instructions in manual, just send and ground no ALC. Would not key Amp, is manual wrong or does
Radio need to go to Yaesu for repair? Could someone please explain how to hook up Amp no ALC just straight to send relay. Amp is Dentron MLA-2500 manual was no help.

Thank You,

Christy Chisholm

Rather then rely upon a solid state keying switch, I just built a very small interface that contains a relay. Now the FT-100 keys a relay which then keys the Al-80A.

Nothing unusual about this type of circuit. It is necessary for most solid state rigs to use something similar on older amps, like the SB series Heaths.

I am using an FT-1000MP hand mike and sometimes the MD100A8X on my FT-100. The XMIT audio is great - so I am told. Much better than the stock hand mike - so I am told. Want to see how I did it? Go here: http://www.qsl.net/w2blc/100.htm and look under Help for the FT-100.

Do I like my FT-100 better than my 1000MP? Hmmmm, let me think about that for a while.

4549. Why did I buy this radio

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-18 13:49:16 UTC
From: vk3kcj@hotmail.com
Topic: 4549 Message: 4549

The more I read this group the more I ask myself the question, why did I not buy a an ic706.

Although I have not had any real problems with the radio (it hasn't smoked), apart from it being deaf on 70 ssb, down on 2m and the swr indicator coming on on 70 requiring a small tap on the top to stop it, I feel the radio is just a problem waiting to happen.
I had only a limited amount of money to spend and the FT100 was cheaper.

In the mean time (in disappointment) I bought a second hand IC735 which is just a pleasure to operate and listen to in comparison to the FT100. It has a receiver that shuts up on a strong signal, the background noise reduces, it puts out about twice as much power (where is the 100w on ssb in the FT100), and this radio is old.

I have had to order every filter and part. The Yaesu agent in Australia carries none, I have had the radio since march and I am still waiting for the oscillator and cw filter. I could not order the radio with the filters in it, they are ordered as spare parts and therefore do not attract the 1 year warrantee.

On the plus side the radio receives well mobile and I get very little noise from my Subaru outback apart from a faint fuel pump hash, and it works well on 10M pactor.

I do find the radio very easy to overdrive, and the transmitted output is dissapointing. If I had my choice I would buy an icom, at least they work and you only hear good reports.

Interestingly my radio has a low serial number but my box has 4 coloured stickers. Something like silver, gold, blue and green from memory. The only bands I have operated on the rig have been 10, 40, 2, 70cm. I hope I get to try the others in the warranty period.

Any idea why the 'S' meter read up to strength 5 with very little signal and not go over strength 9 on a strong signal. Just how linear is it. If I alter the meter adjustment in the second functions, will the weak signals then read 9 ? Whats wrong with 50uv for an s9 anyway. Whatever is correct it would be nice to be able to give a comparative reading to another station.

I will NEVER buy another Yaesu

thanks for reading and 73's
frustrated

You sound like a woman complaining about morning sickness when she
isn't even pregnant!

The FT-100's sound great with an external speaker. What kind of
audio
do you expect from a radio the size of a large hand-held? Just
because you have to order filters has nothing to do with the radio.
All your pissing and moaning... I'll give you $500 for your FT100
just
so you'll quit making stupid posts.

Please... sell your FT-100 and GET and Icom 706 if you think it's a better radio. I'll admit there are some issues that Yaesu should've addressed before putting the radio on the market (I thought it was called Quality Assurance but I could be wrong) and then there have been some issues that have been reported by hundreds of Amateurs and Yaesu denies that these problems exist... this just sounds odd to me. Hundreds or even thousands of people can't be wrong. I've had my share of problems but they were minor and I still like the radio. Here's some of the stuff I dealt
with:

The only real problems I've had with it were noise (caused by the fuel pump on my truck) and the 6 KHz A.M. filter took a dump. With the noise, I was very
disappointed at first because my Uniden HR-2510's NB would knock the noise out all together without any degradation in the received signal. The FT-100, while it has a far better NB circuit than either Kenwood or Icom, it

does distort the signal when on A.M. if the NB is turned up past about 9 or 10. I've been able to reduce the noise almost completely with the exception
for 10 and 6 Meter FM. For some reason I get a 5 s-unit signal level on the

radio as long as the truck is running and is quite annoying. I'm hoping that by grounding the tailpipe I might see a reduction in that signal and the
elimination of the last amount of noise on the other modes. I've grounded all other parts of the truck to the frame already and the antenna is as far away from the engine compartment and fuel pump as I can get it and that took

care of most of the problems.

The only time I've sent my radio back is when the 6KHz filter went south. That
happened one day when driving home and I was listening to some gentlemen on 10 Meters using A.M. I made some adjustments to the radio menus so I could use A.M. and when I keyed up... no output power and when I released the
mic button... no receive. I went to other modes and everything was fine. I

went into the menu settings and shut the 6KHz filter off and the receive came

back but was useless as the selectivity went away. So off to Yaesu it went and
they sent it back in just over a week and no problems since.

My only real problem at this point is what antenna to use. I tried the FC-20 tuner
with a whip but that tuner isn't really meant for mobile applications and would only
tune the whip from 20 to 10 meters and I didn't like having to reach around and
push the antenna button to get 6 meters. So I sold the tuner and purchased the
ATAS-100... good antenna for the most part but I like to off-road a little bit (that's
why I have 4WD) but I've found that the ATAS-100 doesn't take much abuse before
the contacts inside start having problems. I haven't even been off-road with the
truck yet and I'm already noticing the problems mentioned by another operator, and
that's just from driving down some of the poorly maintained city roads here in San
Diego. Because of this, I'm contemplating selling the ATAS-100 (once I address
the clip issue) and trying to obtain an FT-8100 and a 10 meter mobile and stick with
that. I hear Magnum is coming out with a 10/6 Meter dual band mobile soon. I may
check into that.

Anyway, just as a side note, I also own an IC-706 and I think each radio has it's
own advantages and disadvantages.

Life is too short - we need to have a rig we are satisfied with.

I am one of the fortunate ones. I have never experienced any of the troubles with the Ft-100 I've seen cussed and discussed on this list (I didn't buy the ATAS-100).

I expect I'd be as frustrated as you are if I were to have the problems you have.

I have never had a single problem with my radio. I believe that I am in the majority. And that of course you will hear about the problems here. That is what this board is all about. More than likely the people not having any trouble are sitting on their hands or actually using the radio.

To All:

Yes.. there are a lot of us sitting on our hands who read this board and are completely satisfied with our FT-100. I one of those... I sympathize with the individuals who do have problems. I read this board primarily for the innovations that some users have implemented with the FT-100 and also learn from others mistakes. I think this board is helpful in pointing out anomalies that do exist with the FT-100.

Satisfied Yaesu customer.

To add to the list of comments. I am very happy with my FT-100.
The reciever is so much better than the comparable ICOM that
there is no doubt which one I would pick even if I had not had other
problems with ICOM service.
It has a problem that I will send for repair as soon as my 2nd
FT-100 gets here. The debate about service and support is obviously
from people who have never had a new high end DOA radio from ICOM.
They refuse to replace without attemting repair of obviously
nonreapirable
parts. I will NOT under any circumstances buy a new ICOM radio of any
kind until they fix their service policy. Yaesu has been very good to
me on many occasions when I have sent in radios for repair both in and
out of warranty.

For those who are receiving these post and are having doubts about the FT-100, I have the FT-100 and the ATAS-100 both of which have work perfectly from day one.

My FT-100 is installed for my car with the ATAS-100 mounted on a Diamond KT-400. It was all installed in about 4 hours, required no special grounding, and works on all band 40m - 70cm.

There are two other hams in the area with FT-100 which both also work perfectly. Most of the better informed hams here lean towards the FT-100 when asked which radio they would buy for mobile use.

I talked with Mike at Yaesu service and he told me the later production radios do not require any modifications or factory updates. I have a July '99 production date.

Take heart; It is not all bad news, it only seems that the bad news gets all the attention.

I have had my rig for 6 months and have not had a problem. I read this list for 6 months before I bought it just so I would know what to expect(I am also on the IC706 email list). I have research both rigs, I sat down at HRO in Atlanta infront of both rigs for 30 to 45 minutes each just to see how they operated. I found the FT-100D was more to my liking, for a number of reasons which I will discuss if you would like , but not right now.

I have been thoroughly impressed with the rig, I used to a lot of repairs on the FT-101 rigs. For what this rig is and does, it does an amazing job. And yes there may be a few bugs, but to me it is a whole lot easier to operate the FT-100 than the ic706, with or with out bugs. It has a Great Receiver, good audio on receive (not too loud but plenty loud enough), good audio on TX, and it is all in one SMALL package.

I am using my FT100 over a year now on my 30ft sailboat without any problems, using the backstay as antenna.
working on SSB, PSK31 and VHF Marine band FM
Before I used the Icom 706II and was performing very poor on 17-20-15, giving burdies every 5 kHz from lower broadcast-stations during evening hours. (poor front end)

My experience is that the DSP and Noise suppression of the FT100 is much more effective than from the Icom

So this was some good news about the FT100

Hi Hugh

I use the FT100 and a laptop for wx fax, you do not need a tnc, because the sound card is used for decoding
No satelite pictures because the wx stations do not retransmitt them anymore in Europe on HF
I always look on 3853Khz a German station (Offenbach).
For software look at http://mscan.com/index.html performing excellent and is cheap
Probably there is also softwate for navtex, which is not of my interest because I do not sail on the open see
Is a hatteras a sailboat or a powerboat? Major problem on a fiberglass boat is the counterpoise on HF.
under the floor I routed 3 radials (1/4 wave long for each band 10-15-20) of coaxcable connected to my home made
tuning-unit (simple rollerinductor and variable capacitor).
Easier is using the SG 230 Smarttuner
For 2 meters I use the marineband antenne and for 70 cm a seperate antenne both in top of the mast

I wish you good luck and a lot of fun, any more questions let me know.

Chris,

The fault in your radio is a well known one. Take it to your nearest Dick Smith Electronics store and they will air freight it to and from the service department in Sydney at no charge.

Expect to be without your radio for about 7 - 10 days while they fix it.

While the repair is being done, ask them to tune it up on tx and rx. Mine used to put out 70 - 80 Watts, It now does better than 100 Watts on all hf bands and above spec on vhf/uhf.

The boys in the service department at DSE are pretty good at what they do.

Regarding your wait for filters, ring up before you send in your radio for repairs to confirm availability and get the things fitted while they work on it. That's what I did and I'm VERY pleased with the results.

Your FT-100 comes with an excellent warranty. Use it and stop shit bagging what is surely the best radio in it's class in the world today.

YAESU FOREVER.

Hi John. I've been happy as a clam as well. Very pleased with the rig, and with the atas 100.

In terms of "problems" the only one that I have encountered has been a high swr from time to time. Every time this happens, I have found that the cause was the antenna mount on the mobile atas 100. Mine is connected to a trunk lip mount, and from time to time, once in maybe 4 months or so, some of the screws work a bit loose, and make a bad contact with the body of the car. A quick bit of tightening, and away we go.

A terrific rig, and a purchase that I'm really glad I made. I'm sorry that some others appear not to have had the same experience.
William

To All:

Yes.. there are a lot of us sitting on our hands who read this board and are completely satisfied with our FT-100. I one of those... I sympathize with the individuals who do have problems. I read this board primarily for the innovations that some users have implemented with the FT-100 and also learn from others mistakes. I think this board is helpful in pointing out anomalies that do exist with the FT-100.

John and the group,
I have been between there and 14245 for the last 3 Sunday's and have only heard one Staion and that was DL6KAC. He and I finally had to hook up through the QSL/DX net on 14.247. I will be there for sure and the Aussie that complains later in the Egroup about his rig ought to be there too. I have had great contacts into Australia every Monday Night for the WWD net I call on 28.390 @ 2330 UTC. VK2VFV Colin checks in and gives both WH2AAT and I good reports into Sydney, by the way we both run FT 100's. This is a hint as well for some more of you guys to check into the WWD net On 28.390 @2330Z on Monday nights.
73 and hope to hear more FT 100 users Sunday

Chris,
I agree with later posts and you as well. If you are not happy DON'T BUY ANOTHER Yaesu. I have the 10/12 Mtr problem with mine and will be getting that fixed at Yaesu service in the near future. AS far as the rest goes I could not be happier with my FT 100 and the ears. The front end on mine is more sensitive then anything we have compared it too. A good friend of mine is amazed at how well WH2AAT and I can hear things that he cannot. 2 meter and 70 cm recieve is equally impressive on FM and SSB. Sat work has been a joy on this rig disipte the naysayers saying its next to impossible to accomplish. If the FT 100 is hard to work satellites on I wonder how easy an easy rig is. I have full out and More on 6 and 10 meters (125 watts) and never had a bad audio report EXCEPT on AM. So again I say DON'T BUY ANOTHER Yaesu or realize that you may have a lemon and give to a service center to get fixed. If ya bought it new and it's still under warranty send the darn thing off. Tune into 28.390 on a regular basis and give a shout for KG4FET or WH2AAT and listen to what an FT 100 should sound like. You have a neighbor in Sydney (VK2VFV) that checks into our net there on Monday nights At 2330 UTC every Mondy night for the last 6 weeks or so.
73 de KG4FET Sandor proud owner/operator and will buy another FT 100 soon for the mobile

I bought the FT-100 with the full knowledge that the radio has had a few problems. I could ask myself the "Subject Line Question" but I think it is still too early to through my hands up in the air and just give up! Sure my FT-100 has been in the Yaesu Shop for over a month. And sure they can't fix it until they "... get information from Japan" -- which they have been waiting for for a least a full week maybe longer! And sure in a couple of weeks, that is if I don't get it back before then, it would have been in the shop -- (first visit) for longer than I had it in my possession. ..... Ahh ... Why did I buy this radio...? Oh yeah, I remember. It seems that all my rigs are Yaesu and they have all worked without a hitch from the get-go! And Yaesu has always been there to answer my sometimes silly questions with professionalism. So this is my first time sending them a problem that they can actually touch and I am waiting to see what they will do with it. I'll keep you posted.

On a different subject. Can we say the S_ _ _ word on this list? I hope not... way out of place here or anywhere where Amateur Radio discussions are held because there is no minimum age requirement in this hobby, as it should be, and we have no way of knowing who is reading our responses no more than we don't know who is monitoring us on-the-air. Please keep this in mind and all have a great weekend.

Probably because, spec for spec, it is more radio for the money. I did the same, even though I was well aware of the common problems with this rig (and the FT-847). Let's face it, these are a whole lot more complicated and a whole lot more bang-for-the-buck than radios were just 10 years ago. Several key distinctions from the IC-706 are swr meter, keyer, and vox (albeit, I do think the Icom has a better menu system).

> Although I have not had any real problems with the radio (it hasn't

The reduced ssb sensitivity is due to a known bad thermal problem with IC NJM2904V-TE1. I had the same thing and Yaesu service turned it around in short order, although I'm still corresponding with them about the new (not asked for) thermal switch they added that runs the fans MUCH MORE often--almost continuously.

As long as I'm on the soap box:
1) this is a public forum and should be treated as such
2) this rig works fine for satellites, even if not full duplex
- I have worked ALL the analog birds, including AO-10 barefoot
- the V/UHF sensitivity is outstanding & selectivity is not an issue for satellite work
- the VFO capability is much better for the FM birds than the 5 kHz mobile rigs
3) if you think this is small, wait until you see the FT-817 all-mode rig.

73,
Jerry, K5OE

4576. Squelch, no more working!

After few minutes of work, the squelch is no more active, I can try to turn the knob full clock wise, I still have the background noise!. The green led which light on when the signal open the squelch work normally!!??!!. My ft100 is a 9E... series

What I did up to now
Shut down the radio for 30 min = the squelch work fine for 5 min
Connect and disconnect the dc cable = no success
General CPU reset = no success
Send the radio to Yaesu = work fine for one month and then (I don't
know what they did on this problem)

Thank you very much in advance for any help, suggestion, advise,

73's Ferdy HB9ULO

4577. FT100 wish list. Why I would buy another FT100

I like my FT100, it works great. I sent it in for repair work once. They did a fine job and I had it back in under two weeks from when it left my door. Lets see, I have had mine since last December and use it 12 hours a day.

I will buy another one but the upgrades will have to go like this for me to do so. (Are you listening Yaesu?)

1. A noise blanker that works good on 6 FM
2. A better audio amp. This one is poor or weak in the fm mode on 2 and 440
3.Computer programmable, 300 memory channels and you cant program it with the computer. What?
4. Direct frequency entry from the keypad. Huh? what happened here?
5. And last but not least. the addition of the 220 band and the ability to assign bands to one of three antenna ports.

Those are the essentials of what it would take for me to upgrade to the next version. Next is what would be nice but I can live without.

1. Back lighted buttons.
2. Alpha numeric display.
3 A display with black digits that you can select colors.
4 1.2 Ghz band
5. It would be OK with me to make a bigger version with
a built in tuner.
6. Move the mic jack to the outside of the radio.

Well (a deep subject I know) there you go that is what it would take.

Best Regards, Dan KM6CQ

You forgot to mention the lack of an ATT / PRE-AMP that works for 2 meters / 70 cm. The FT-100 gets more intermod than my 706G and without an ATT button to use when downtown the radio (FT-100) gets overloaded with IMD where-as the 706G won't when using the ATT / PRE-AMP. Still anyway you look at it, the ATT / PRE-AMP button should work for 2 meters / 70 cm also.

hmm, mine don't get intermod when I am down town. Except for within a 1 block radius of a tower with 45 transmitter at 120'. There are 4 known dirty transmitters on this tower. but other than that mine works great.

the antenna that I am using is a Diamond sg7900 dual band. It is fed from the radio to the duplexer with LMR240. then into a 2 meter amp and a 440 mHz amp, then into a second duplexer. then a short piece of RG58 ultralink cable to the thru the body NMO mount. Any way that is my set up for 2 meters and 440 mHz. I do have a preamp that I run on 2 meters and I am getting ready to install a 440 mHz preamp.

No, but I'm going to try to change this menu when the problem happen again
just to see how the squelch react when I go back to the normal setting...

Thanks, Ferdy

Good to see you don't have a real name. My FT100 is always used with an external speaker. The radio does not quieten on a stong signal and displays noise. I have a uniden hr2510 that is quiter on receive with a strong signal. Congratulations, this is my last post, but at least I sign mine with my name arsehole!

Thanks for the reply, I guess the radio is OK, I worked into England on 10 the other night with a half wave vertical at 15 feet.. It is amazing technology stuffed into a small size. I intend to use a terlin outbacker (Australian made) which is a tapped antenna not as convenient but bloody strong and reliable. Have you seen a source for the cat plug, other than the genuine, I was able to get the data plug OK. I also have a uniden hr2510 and have used it mobile, in fact 10 meters was the only band I operated apart from the usual 2/70cm repeaters etc.

Vehicle noise is a real problem, you would expect in this day and age where there are so many electronic devices in cars that the manufacturers would get it right. I have noticed that with current vehicles the noise has dropped here, also the japanese seem to manage to keep their vehicles quiet and I was very lucky to get a vehicle that was.

My installation of the FT100 in the car has been quite successful the only problem being that the roof racks are not grounded to the body, but I tried earthing the coax where I exited the body and got a good match. The radio is not even grounded to the body, but is connected directly to the battery with very heavy cable, not the one supplied.

I guess my dissapointment is in having spent A$2500 on a radio, I find that it has known problems, and every amateur I have spoken with knows them also. Therefore what are my chances of selling it without suffering a severe loss.

you win some you lose some and I guess the radio mostly works

Rob:
Have you tried adjusting the RF gain? You can use it to reduce the gain of both the RF and IF together. This should reduce or eliminate overload problems. Adminttedly, the ATT/Preamp button on the 706 is a bit easier, but frankly, considering how much more difficult the 706 is to operate on the road, it's minor advantage.

I just installed My New Ft-100 today and it seems deaf on vhf and uhf . I'm running a diamond cr 627 nmo that I was running with My tm-742. I'm within 5 air miles of 5 repeaters that I work fine with an HT and only get like a s-5/6 on the ft-100. The swr is fine and it is putting out the power , it just can't hear . Any suggestions before it gose back to yeasu ? tnx & 73's K8WGB

Are you saying it can't hear based on the S meter reading alone or do the repeaters sound scratchy and weak? Have you tried any public service freqs?

The ft100 tends to be a bit conservative in the S meter readings. If it's deaf according to your ear, that's another thing of course.

Had the same problem with my unit after a week. Sent it back and had a transistor replaced. Tech said they had never seen anything like it, but since then, I've heard of several other cases.

Also, since it was shipped back to me, I get an SWR warning on transmit. Testing with a MFJ 259B shows an SWR of 1.2:1. Radio still works, but it is an issue I intend to get worked on again under warranty.

Otherwise this is a VG radio.

By your description, it sounds like something is definitely wrong and
not a characteristic of the radio. Yes, the 800 meg receiver is quite
deaf, but it's not terrible on VHF/UHF. Will the dealer exchange it?

I am about one mile from our vhf repeater on a 300' tower. The FT-100 is S-9 in my driveway, yet it hears as well as my IC2350 on the fringes of repeater coverage. I dont believe the meter is showing limiting as most FM rigs do. Make your judgment with your ears on marginal signals, compared to a known receiver.

I called AES and talked to Miles , the service manager , He allowed that several had been sent in with this problem but were within Yeasu's spec's . I'm going to take it to a Friend of Mine tomorrow and let Him check it on His IFR com-120 before I start the mail thing. it seems to do well on hf but is terriable from 50 Mhz. up . it puts out good power all around . AES did say if there was something wrong with it they would send another one....

New 160 - 70 cm all-mode (5 W with option for batteries).
Per N1GKZ and XE1KK, it will be on sale in US by December for less
than $1,000. It appears to be not much bigger than the FT-90.

Topic: 4586 Message: 4595

My FT-100 is about 3 weeks old (older version) and I experienced the same thing. I work FM simplex a lot, and I could not even hear some of the guys I could hear on my cheep (other manufacture radio). I turned up the AF-RF gain and now it hears as well as my cheep rigs.

Now I have a 220 repeater 3 miles from me, I tuned to it, and had my buddy key it from his house. I could here nothing at all, while he is 10 miles from it and has a full scale reading. Is this the way the FT-100 works on bands that it can not transmit on?

It seems that it dose not do well out of the ham bands either. Or mine dosen't anyway . But I guess they don't promise much out of band. I found the information on the internet last night to get in the alignment mode and set the rf gain for each band , I will try that before I send it back. .....73's K8WGB

4602. Mobile Installation on Pontiac Grand Am

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-22 17:29:51 UTC
From: gerald.kopstein@us.ul.com
Topic: 4602 Message: 4602

I read with interest all the tidbits everyone shares on this group and
take in stride the negatives and positives for what they mean to me.
As I have reported previously my FT100 went back to Yaesu after a few
weeks (caught fire if you recall!!!)and came working like a champ.
I'm happy to report that I have not experienced all the problems many
of you have seen.

But in light of my recent mobile trip, 2500 miles and eight days
later, I thought I'd share recent happenings to see what you all have
to say. Made over 600 contacts mainly on 20 meters. Some on 40
meters. Everyone said the audio was excellent and had no trouble
working Australia and Japan on the go - 59+ signals around the world!

The receiver worked like a champ. I could pull anyone out of the mud
who tried to get me. Antenna was Hamstick mounted on a license plate
mount at rear of car.

By adjusting the whip and the base coil, a swr of about 1.3 to 1 could
easily be achieved.

I've had many mobile installations in the past so I'm well aware of
good grounding. Ground straps were used at the antenna base even
though the mount was secured by stainless screws to the frame. Ground
straps were used under the hoop to ground various metal parts to the
frame - such as hood. I even ran a separate ground lead from the
FT100 to the frame in the engine compartment. I ran separate 10 gauge
leads directly to the battery for power. The unit sat right on the
dash and kept quite cool from the defrost air vent! I used the Heil
headset with VOX operation. Therefore my wife could easily read while
I operated!

I gave the above details so you knew more on the installation, before
I reported on the problem encountered.

On the third day into the trip, while operating constantly each day,
after parking where we were touring, the car would not start. We
attempted a jump and still no luck. So many hours later it was towed
to a Pontiac dealer. The next day we luckily got the car back after
having to rent a vehicle in the mean time. Diagnose, battery was
completely dead and just needed a charge! It was reported that the
charging circuit was working fine plus the alternator was doing its

job. They believed that I must just be running too much current in the HF transmitter I was using. Go figure! Remember, I never operated without motoring or at worst stopped with the engine running.
And very little stopped with motor running.

We took off heading west. A day and half later, guess what? Yep, parked at hotel and car would not start again. Lucky for me a Kmart was right next door, since all dealers were closed for the weekend. Got a charger and a new battery just in case. Put new battery in and the way we went.

Now listening to you all every day got me to wondering whether my rig had something to do with this. So after some 'encouragement from the wife', I never operated again while the car was on. You know what, all my troubles went away!!!!! I surmise, and I wish I had some meters to have checked further, that my problem was the FT100 emitted signals that interferred with the cars computer. Either due to some constant oscillation put out by the rig or maybe due to the rf during transmit. I really believe it had to do with a constant oscillation to have shut down the charging circuit completely. I only transmitted
for a few minutes at a time with hours sometimes between contacts. And the second time the battery went dead I was doing mostly just listening.

So, thoughts anyone? Cures?

If someone from Pontiac or Yaesu is listening, I would think each would be concerned that something did not go awry with an automobiles safe operation. Luckily in this case it did not.

I look forward to suggestions on fixing this problem, since a year down the road I will be driving the vehicle back from California, operating my FT100.

Thanks for listening, N9AC - Jerry

Do you leave the rig connected to the power when it is off? Could it have drained the battery overnight? Maybe not since it sounds like you were running the motor while operating, then stopped and found it wouldn't start.

I ask because I'm using mine with a switcher power supply and I notice that with the radio off, when I turn on the power supply the radio makes a little 'startup noise' and stays off. The power light lights briefly then shuts down. That makes me wonder if the rig wants to draw power even while turned off?

Still, it would seem like it would have to do that for an awefully long time to drain a car battery. Also, the alternator would have to be working while the battery was dying or the engine would quit! Not like a diesel which doesn't need power to run. If the alternator quit in a diesel you'd slowly see the lights dim as you drive at night (as happened to me once).

Very puzzling - what role does the car's computer play in the charging system? Seems like it should be pretty simple - car runs, alternator runs, alternator charges, that's that.

Puzzling!

I would bet comfortably you had a bad battery or your charging system is too small to handle the additional load of the FT100's transmitter. You might check and see what size your alternator is. I maintain over 300 mobile radios and 150 mobile data terminals and bad batteries are a constant problem. It has been a 16 year long battle, and its not over yet, to educate the auto mechanics about battery problems..if thier tester says its ok...it must be ok.sure! Good luck and please let us know if the old battery was properly tested prior to disposal.

Brian,
Rig is always connected to battery. Only on/off switch used to shut off rig. Rig was never left on without car running. I would hope the
rig draws no current in off state! I also have a switching power supply and I know what you mean by the appearance of the unit trying to start.

As for computer, I thought nowadays the cars are basically run by a central computer module. Maybe it is only a charging module that governs when the alternator supplies current to the battery. Our GM experts please feel free to set us straight on this. In any case the puzzling part is what can be affected by an oscillation or rf within an automobile to cause such to happen with the battery?!

I'm all ears.

GM had a booth at Dayton this year talking about mobile
rig installations. They had a little blurb from 1992 they
were handing out. No info on it on who to contact with a
problem, but I checked out their website and found a
phone number for Pontiac customer service 1-800-762-2737.
Maybe that's worth a try?

I talked to Yaesu today. They said think of it as the FT-100 without
the 100W amp. It's about half the height.

New 160 - 70 cm all-mode (5 W with option for batteries).
Per N1GKZ and XE1KK, it will be on sale in US by December for less
than $1,000. It appears to be not much bigger than the FT-90.

Topic: 4602 Message: 4608

also make sure the check the specific gravity of each cell. that is about the only sure way to see if a battery is up to par.

A few months ago I installed a HF rig in my car, and I noticed a lot of noise 20 to 40 over 9 with out the noise blanker. I went to a battery shop here in town after the GM dealer said that my battery was 100% of CCA. The battery shop checked the specific gravity at my request, the negative cells were ok, but the positive cells were just below acceptable. I changed it out with a optima battery and the noise went down to S7.

I would bet comfortably you had a bad battery or your charging system is too
small to handle the additional load of the FT100's transmitter. You might check and see what size your alternator is. I maintain over 300 mobile radios and 150 mobile data terminals and bad batteries are a constant problem. It has been a 16 year long battle, and its not over yet, to educate
the auto mechanics about battery problems..if thier tester says its ok...it
must be ok.sure! Good luck and please let us know if the old battery was properly tested prior to disposal.

Topic: 4611 Message: 4611

Dear All,

I've just subscribed to this list yesterday and have been trying to get some information about a problem I'm having with my FT-100. I bought it about 10 months ago in the U.S. I'm an American (WB0TUA) living in Melbourne, Australia right now (VK3FLQ) for a year.

My problem is on both HF and VHF. I have never thought that this radio was particularly sensitive but I enjoyed using it anyway. A few days ago, I was using the ATAS-100 antenna and trying to tune up on 40M from my hotel balcony (it usually works). I couldn't get the radio to tune the antenna successfully in automatic mode so I tried tuning it manually using the microphone buttons and the front panel UP/DOWN buttons. Still no luck.

I tried tuning it on other HF bands (e.g. 20M) and it worked fine. After another 15 or 20 minutes, it ceased to tune properly on any HF band. I checked the antenna, coax, etc. and all seemed ok. I then powered off the radio and powered it on with no luck. Then, I suddenly lost the ability to hear anything on any band. Not even rush noise.

I turned off the power supply to the radio in addition to the radio but that didn't help either. I decided to try the Reset and Delete Memories detailed in the manual. This didn't work either. I then tried the Reset Without Deletion of Memories and that worked (though it also deleted all the memories).

Now, I can hear on both HF and VHF bu the S-meter shows no readings on VHF and maybe one bar on HF. I decided to try the S-Meter alignment that has been discussed here. I tried to go into the alignment mode described on the FAQ web page by K0LEE (pressing and holding in A-B-C while powering the radio on) but when I pushed the "FUNC" key, I didn't get the alignment features described on the FAQ. The FUNC key just displays the normal items.

Can anyone offer any suggestions? Thanks to anyone who can help me!

Just as a general interest item ..... help is on the way. It's at least 3 years away but due to the high (and increasing) automotive electrical loads the push is on to switch from the current 14 volt system to a 42 volt system. I hope that the ham equipment manufacturers will be ready. This change will also help with gas mileage. I found it hard to believe but Mercedes was able to strip 600 pounds of copper wiring out of one of their models by switching to a high voltage system. This should make installation of "high" power ham rigs much easier and save us a few bucks on copper too!

Huh?

They stripped out 600 pounds of wiring and the car stil worked?

Just what was all this wiring for?

Just how big is this particular vehicle? An 98 E300 weighs in at about 3600 lbs.

I have seen this problem in several GM vehicles with several different
radio
setups at different times of the year (temperature). The common factor
was
the Delco battery. When this battery was replaced the problems went
away and stayed away. In each case the computer at the local GM dealer
said that the battery was good.

FWIW, on a recent business trip I left my Jeep parked in my garage with the FT100 off but still connected to the battery. 6 days later the battery was dead, well, not dead, just wouldn't turn the engine over. Since that trip I make sure the power is disconnected if I'm gone for more than a day or 2.

I was wonder who was running an amp with your FT 100 in a mobile installation. A buddy of mine is considering an FT 100 for his mobile after seeing mine in action a couple of times. He has a High Sierra on the mobile now and wants to run a solid state amp such as the the Ameritron ALS 500 or 600. How easy is it to hook one of these up. I appreciate any info you guys can provide and I'm sure he will too.

I am running the Skywalker 500 and using the DK3 screwdriver on my GMC Sonoma. It works great and the FT-100 will key the amplifier directly. I did run 2/0 jumper cable wire back the the amplifier to make sure that it get plenty of power. If your friend is into building I think it is a great little amplifier and he can get some extra fun out of building a solid state amplifier.

Agreed. It is probably a fluke, either in the radio or the installation.

Since you are a ham, measure the current drain when OFF. Unfortunatley, auto techs don't usually have a great grasp on current vs. voltage, but if it is on the order of milliamps you can presume it will not drain the car flat anytime soon.

Just got back from the ARRL New England Convention in Boxboro, MA. At the Yaesu booth, they had a prototype of the new FT-817 radio there. They didn't have any brochures for it to get the specs on it... because it was only a prototype.

It was a nice looking radio. One of the web pages that was listed a few days ago for info on this radio had a price of about $1050 for this radio (if you were to use the current Yen <> US Dollar exchange rates). Not sure if I would pay that much for a QRP radio like this. Maybe if the expected price of it was to drop a bit, then I would consider getting one.

According to Yaesu that is everything.... Take a look a www.yaesu.com .
There you can see the "official" page.

4623. FT-100 with remote band-switchable external amp (e.g. SG500)

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-27 02:36:06 UTC
From: Scott Townley
Topic: 4623 Message: 4623

I have an SG-500 that I'd like to fully interface to my FT-100 (fully means using ALC, band select, sequenced PTT--the whole works).

I have the two units' ALC specs and figure I can work with it--the FT-100 is 0-4V negative and the SG-500 is 1-5V positive, so an inverter and level-shift circuit will do the trick...

The "QSK Delay" function in the FT-100 should work nicely for T/R sequencing. I am prepared to use an external sequencer if needed (for
SSB or if QSK Delay doesn't do the trick).

But...the BAND DATA cable is intriguing..."BAND A, BAND B, BAND C, BAND D, TX INH" are available (along with 13.8V, GND and TX GND). I would assume TX INH is TX INHIBIT, but the manual gives no hint as to how that line works. And how to decode BAND A-D? Any ideas/experience/suggestions? Could I be so lucky as to have that be BCD encoded somehow? The SG-500 will automatically band select with a
supplied ground signal so some circuitry would be required, but I can do that as long as I know what I'm working with...

(Yes I know the SG-500 with RF-sense band select but all indications are that the time delay associated with that borders on useless, especially for CW QSK).

Thanks in advance,

4624. 40M Performance

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-27 03:26:17 UTC
From: James R Vilbert
Topic: 4624 Message: 4624

I have not posted much to the group even though I have had the FT100 for about 7 months now. I have been very satisfied with it and have had no problems with it.....until now.

When on 40M CW I hear every (and I mean EVERY) broadcast station on the CW portion of the band as well as the CW signals, RTTY and of course the seasonal QRN. Since I have not be operating much on 40 CW, I have not noticed or maybe not cared much, but tonight I connected the FT100 to the Ten-Tec Centaur linear to see how well it would interface. The interface was great and works FB, but I could not hear much with all the broadcast stations. I know that there was no stations on those frequencies because when I turned on the Ten-Tec OMNI 6 sitting next to it, there was no broadcast or any other interference.

I know the OMNI is a better rig, but I have never had any rig with this type of problem. I guess the question is, is this "normal" for an FT100 or go I have a problem that I should be sending this back to Yaesu for correction?

Would appreciate any and all responses. If it has to go back, would like to catch it while it is in warranty.

Thanks,

Jim

This is a complete mobile package ready to install.
This has Never been mobile.
I have the FT 100 bought new in April 2000. I have used it in the shack, works fine. I have the Diamond K400 hatchback mount which I will throw in if you have a hatchback.
Included is the Diamond HV7A mobile antenna and I have the 20M 15M and 40M loading coils...never used.
Included is the YSK 100 separation kit.
I paid about $1300 for all of this.
I will take $1100 or best offer.
If you give me my asking price, I will ship it to you at my cost.

Richard

Date: 2000-08-28 07:44:14 UTC
From: Derek Cohn
Topic: 4627 Message: 4627

Dear All,

A few days ago, I posted a message that I was having trouble hearing much on my FT-100. A list member, Jim KB6SX, surmised that my ATAS-100 could be the culprit. Though it tunes up fine, it just didn't hear much. Jim suggested locating another amateur in the city I'm visiting (for a year) and testing the radio on his antenna.

I did find a local ham here in Melbourne who volunteered to let me use his multi-band HF trap dipole. I plugged it in and the signals came pounding in. It was quite impressive. Even managed a couple of QSOs with it. The trap dipole had miserable SWR on 80CW but the FT-100 reduced the power appropriately and I was still able to maintain a sked on 25w. The ATAS-100 may not be guilty all by itself as my downtown location probably is contributing to the poor reception.

Special thanks to Jim KB6SX and the other list members for assisting me in solving this problem.

Hi Denton,
Yes, I have used it recently for a 2500 mile trip with the Hamstick 20 meter antenna. Worked great. I used the hamstick plus their separate base coil in order to get the SWR down to 1.2 to 1. This was mounted on a pontiac GrandAm. I ran two screws straight through the stainless plate into the bumper.

in light of mike's statements above, may be it's too soon for me to be asking this, and i don't yet have an ft-100 to know concerning it's specs, but what is it that the ft-817 is supposed to do that the ft-100 doesn't do already? is the ft-100 not able to run w/i the qrp power levels of 0-5 watts? or is it more like typical mobile units having only 3 or 4 power level choices (which may differ depending on the band in use) w/maybe 5 or 10 watts as a minimum.

thanks for the info. i'm enjoying this group, however, working thru. all the archives is taking forever :o) !!

It's my understanding that for one, the radio will run off of AA batteries for
2 watts output (CW, SSB) so the power requirements are different from the
FT-100.

The 817 is supposedly a low-current drain, QRP version of the FT-100. I
own an FT-100 and even at QRP levels, it pulls four or five amps on
transmit, over an amp just on receive!

Today, we (on the 817 email reflector) learned that the 817 does not have
the neat DSP functions of the 100, but that no doubt cut some (a lot) of
the RX drain off the 817.

Hi Guys ...

I really need some feedback from some of you guys today! My 2-month old FT-100 with the 6k & 500 Hz filter installed is still at Yaesu for repairs. Yaesu told me this morning that they had finally received an answer from Japan regarding the loud popping sounds the rig makes on CW when the rig switches from Tx to Rx while using the 500 Hz filter. It pops after each character sent when in Full-Breakin. They have had the rig in their shop for over a month!

I have been given the options of: 1- Get my money back for the rig and ATAS-100 or 2- Get the rig back as is and use it until Yaesu figures out how to fix this problem. I asked about a new rig and they tell me that it wouldn't matter - they all have this problem!

I would like to hear from FT-100 owners that have had the 500 Hz or the 300 Hz filter installed and use the rig for CW. Does your rig POP in transition from Tx to Rx? If you are willing to discuss this with me please email me direct and if you include your phone number I'll be glad to call you at your convenience.

I am really at a crossroads here. I like the rig very much and it has worked just fine with this one exception. But then again, I only had the rig for 2 months before I sent it back to Yaesu. I would really like to hear from you!

It seems the best choice is to get your money back. You could always buy another FT100, or wait to see what this new Kenwood DC to light is like. I really don't like the "they all have this problem" message from Yaesu. When Yeasu says this, it is a clue the problem will not be fixed, such as the worthless CTCSS on the VX5. [Yes I do own Yaesu stuff, but I am particular what I buy, and never purchase stuff from Yeasu when it first comes out. Yaesu is the most innovative HAM company around, but their products are never properly flogged before being released. Yaesu does support the customer to a degree, but like the VX5 CTCSS, after a while they just give up.]

Hi

just installed my CW-Filter (500Hz) and I have the same "problem" (in fact it is not a real problem for me).
I bought the rig last year in september and was happy with the DSP filter on CW.

No trouble so far .
I dont like the separation kit for this rig (YSK-100 ?). Why did they use screws for fixing the plug at the
transceiver side?

4639. 6kHz AM filter.....

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-28 21:17:19 UTC
From: Charles Stampf
Topic: 4639 Message: 4639

Hi Group,

I just installed the 6kHz AM filter in my FT-100.

I frequently like to listen to foreign broadcasts while motoring down the highways at night. I enjoy the BBC and VOA programming. Once in a while I'll tune in the Russian news. Before the filter, the FT-100 exhibited characteristics of a $5.00 handheld AM transistor radio and as broad as the proverbial barn door.

Now, many of the foreign stations just pop right out of all the backround din. It's a pleasure to tune across the band an take advantage of that new selectivity.

If you're at all inclined to listen to AM broadcasts, please consider installing this neat little filter. Installation is not difficult. Just follow the directions in the owners manual......it's a snap!

Topic: 4636 Message: 4640

Hi Denny,

Mine is going in to Yaesu for upgrades today or tomorrow.

I also have poor QSK when using the 500 Hz filter. Not sure that I'd discribe it the way you do but that's very close to what mine does.

It goes from sounding as good as anything TenTec ever made when not using any extra filters, to sounding worse than my 1000-MP when using the 500 Hz filter. That is the only extra filter I have in the rig so I don't know what it will do with any other options.

Poor QSK is one of the items I am asking to be looked at. If they gave me the same choice, I think I'd go with keeping the rig and hope they get a handle on it.

I got fed up with Icom during all those years when their rigs chopped off the first dit using their super poor semi VOX keying system.

I've worked on a few Kenwoods and didn't like what I saw on the under side of the bords! (Up to 3 transistors where they had made changed but not upgraded the boards. Plus I have seen MANY 930's with the plated thru hole problems that were never resolved.

So I'll stick with Yaesu so far. All my dealings with them have been more than fair....but that's only been a couple over the years.

And when I bought a "new model" I knew I'd have to get some upgrades sooner or later. And maybe find a few "bugs" that needed to be fixed, IF THEY COULD BE.

It's like buying the first few releases of software! I always wait until someone else has done the beta testing.

Overall, I really like mine.

This time I chose to be one.

OK, back in my hole,

From: Damien Keffyn
Topic: 4643 Message: 4643

Hi Group,

I dont want to make waves here as I have just joined this list, I have however read from message 1 to 4641 to get to

know you all.

Ok I asked for a mod that would allow me to get mt FT100 to transmit in the 476-478mHz region, I think I need to

clarify what this question is actually for.

476-477mHz is the standard run o' the mill 40 UHF cb here, it is quite common for units to go missing from vehicles

and I dont want to lose mine. I have no intentions of using this radio for any "high powered I am god" type use I

simply want 1 radio in the car and 1 radio @ home, it will be running on the allocated power for the allocated band.

If little Johnny can go to Dick Smith or Tandy and buy a Uniden 5 watt radio, take it to Sonny Jim and boost it to

12 watts then sit on a repeater dropping carriers and playing music for hours on end, then I cant see a problem with

me having a mod to allow my radio to do what I want it to do.

I have read about the "wideband" mod which is quite common, this allows full transmit on Australian Police and

emergency services radio band, but when I ask for a common band mod I get shot down. Go figure....

The other problem is between 136-138 mHz, I cannot get a picture from a wxsat, all I recieve is wavy lines that look nothing like a wxsat or wefax transmission, anyone have any luck getting pics with this radio? If so how? I use WXsat (for decoding) NOVA32 (for tracking) Soundblaster Live! and a cable to the speaker out, I am sure it sounds lame, but I have been trying for months with no success...

Dont forget I am not looking for a fight, just a mod....

Subject: Satellite reception & other matters

I am having a lot of trouble recieving WXsats with this radio, anyone have any Ideas??

I am also chasing a mod to allow transmit between 476-478 mHz, this is to allow me to transmit on the Austrlaian UHF CB band, thus cutting down the amout of radios in my vehicle. I have heard it is a matter of removing a cap somewhere on the board.

Damien D Keffyn
ICQ 1680281

Damien
I have not tried the WXsats yet, I will post my results when I do. I have had good results on HF voice with the radio.

I have done the mod posted on this site by removing two resistors and some programming. My UHF rolls off to less than 2 Watts at 460 -470 Mhz, and displays icon "OFF" from 470 up. I graphed my results and placed them in the "files" section.
If you find a mod that opens up 476-478, let us know.

From: bruce@perens.com
Topic: 4645 Message: 4645

Hi,

I would like to use the ATAS-100 for VHF/UHF as well as HF. I know its performance at VHF/UHF is poor, but it should be sufficient for the metropolitan area I live in and I've a bigger VHF/UHF antenna for when I need it.

What duplexers have the DC continuity required by the ATAS-100? Should I just use a coax relay instead?

Thanks

Bruce

now now... it's not a long boom yagi, but don't let the boo birds get to
you, the performance on VHF is fine. Especially for what you (and most
of the rest of us do).

never properly flogged before being released. Yaesu does support the
customer to a degree, but like the VX5 CTCSS, after a while they just give
up.]

From monitoring the VX5 list they fix the CTCSS problem by replacing a major
part under warranty. (microprocessor)

Not exactly "giving up"

Hi Denton,

Before I saw the commercial license plate mount, I built my own at the hardware store. I went to Home Depot and bought 2 galvanized L brackets, a 6" x 2" x 1/8" aluminum strip and 2 SS nuts and bolts to hold it together. Total cost less than $5. The L brackets slip behind the license plate and extend over the top for the aluminum strip to be mounted with the bolts. 2 brackets made the mount more stabile than I imagine the single bracket commercial mount would give. I drilled a hole for my Comet SO-239 type mount and ran a 2" wide, 8" long braid from the bottom of the mount back to the trunk body. I scraped some paint away behind the license plate where the braid is bolted to the trunk metal. I spray painted the contraption dull black and screwed on my ATAS-100. The flex in the aluminum strip acts like a spring to give you a bit of flex in the system. It works, and looks, like a champ on my Lexus LS-400.

Good luck,
Bob K5WA

Subject: Mobile antenna question

Hi Guys, I'm new to the list here and sorry if this has been discussed before.
I'm looking at some casual mobile operation. Has anybody in the group had any experience with the license plate mount that Lakeview antennas is offering? I like that idea better than a mag mount for a lightweight whip. Any comments pro or con are welcome. I don't plan to do any long distance mobileing, like cross country like that.

I'll be running my new FT-100D in a 91 Pontiac Bonneville. Got a new position at work, so I had to buy a new toy :-)

Hi All,

If you move your radio from location to location a lot,
why not just install a plug in the remote cable?

Mine stays in one place so at this point it isn't much
of a problem messing with those little screws.

But if I decided to put it in the truck too, then I'll
sure give that idea a try, unless someone can tell me
why it can't work. (And even then I might try it
anyway.....after all, I am a Ham which means that I
really should try things!) :-)

Date: 2000-08-29 23:27:09 UTC
From: ad6ez@aol.com
Topic: 4655 Message: 4655

Hey All -

Yep! I took the road less traveled and, like Robert Frost's poem says, "... and that made all the difference". At least I hope it will! I took Yaesu's Option No. 1 and have requested my money back for the FT-100 but not the ATAS-100. I'll keep that and use it with my next mobile rig.

I couldn't decide whether to keep the FT-100 as it was or not. It just didn't seem like the right thing to do. I'm going to take about a month and think about what I am going to do about another mobile rig. I won't have my F-150 around for that length of time so the new rig would just sit around the shack anyway.

I do want to thank all of you who responded to my e-mails during this past 5 weeks while my FT-100 was in the shop. This is a great list with a bunch of great folks. I'll hang around for info on the ATAS-100 - I worked up such a great antenna mount for this antenna that I just had to keep it! Hee

Tnx Agn -

My two cents worth:
Lets face it the CB operators are the reason that we can not purchase amplifiers that will function on 10 meters without modification and require 100 watts of drive. Government intervention is only punishing the innocent and not the guilty.
I feel that any CBer found to be operating any kind of amplifier should be fined $1,000,000 and spend about 5 years in jail.
Maybe after spend a few year with some good buddies they would learn not to be so quick to break the law.
Hang um high!

Date: 2000-08-30 02:59:41 UTC
From: James R Vilbert
Topic: 4661 Message: 4661

Several days ago I posted a question concerning lots of braodcast interference in the 40M CW band on my FT100. I am getting lots and lots of the interference, but when I listen to the same portion of the band on my TenTec Omni 6, the band is clear with no broadcast or other interference. I asked if anyone else was experiencing this type of noise.

I have not received one response to this question. Is it safe to assume that I am the only one having this problem and I should send my rig back to Yaesu, or is there a silent majority out there who don't want to say. Maybe I am the only one working 40M CW with the FT100, something I really doubt.

Anyway, I am still looking for any opinions and experience that you may have had. Still need to make a decision on repair or standing pat.

Thanks,

Jim

Try using it in CW Mode with the 500 Hz filter selected. You'll have better than a 75/25 chance of finding that this has been a problem waiting for you to find. If it still works great then you had better hang on to that FT-100 - it's a real keeper! Better yet send it to Yaesu so that they can figure out what they did right and pass it on to everyone else!

Jim,
I also have the broadcast station problem on 40 meters cw portion of the band. I don't sweat it all that much as it is only happening at night and most of the 40 meter work I do is during the day. I haven't tried to adjust it out through the DSP and other options, but I will to night.
73 de KG4FET Sandor Proud owner of an FT 100 I can be found on 28.390 most of the time during the day so giva a shout and say hey if the band is open.

james,

don't know if you got the following message, or may be it doesn't answer your question, but denny mentioned that he has the 500 hz filter and has problems w/some noise while doing cw. jim responded as follows:

Denny,

Have had my rig for over 7 months and use it almost exclusively for CW on with the 300 Hz filter on full break-in. I have not noticed any pops, but will listen for them the next time I operate.

Jim
K3WU

hope this at least gets you started w/getting some answers.

j

4668. CTCSS squlch pops with no tone

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-30 12:44:18 UTC
From: Jeffrey King
Topic: 4668 Message: 4668

Does anybody have a CTCSS decoder in their FT100 that works. By works, I mean you can go to a clear frequency, open the squelch, turn on ctcss, and not hear any squelch pops.

I listen to wide band fm on my ft100 (tv news), where I have to have the squlch open because of the weak signal, and when I jump to the local repeater with pl encoded on the ouput, I expected the ft100 receiver to stay quiet when I had the ctcss on. Instead I get annoying squelch pops every 20 seconds or so, even though there is no signal, and therefor no tone to be seen. (This is complicated by the fact that I have to wind the audio up for the wideband fm stuff, and then I get hit with LOUD squelch pops on 2M FM). Anyone else NOT having this problem? (I'm hoping it's something fixable)

I have same problem, even when squelched. Had the same problem with 706IIG. Use the FT100 mostly for 6, 2, 432 SSB and HF. FM is very annoying, as I like to use tone squelch to keep it quiet. Use a ic2350 for FM.

Jeff:
Frankly, I'm happy with the CTCSS decoder in my FT-100. CTCSS decoders were never intended for open squelch with no signal and to expect one not to false in that situation is unfair. I don't think you can expect a decoder not to false on noise since there will by definition be some energy in the bandpass of the decoder. When there's signal, the bandpass of the transmitter audio results in little energy down in the range of the PL tones, which is why you should not see falsing with a good signal. You can make a decoder less sensitive to noise by slowing down the decoder, but something tells me that if that were the case, there'd be people complaining about slow CTCSS decode time ala VX-5 (clearly an extreme case, even with the update it's kind of slow). In short, I think you're complaining about a feature of the radio--fast decode times.

Topic: 4661 Message: 4672

Hi Jim,

I use my FT-100 on 40m a lot. I'd guess about 95% of my time on the rig has been 40m CW. (I have never even tried it on SSB yet....but I've only had it for a little over a year!)

I find the RX to be just fine. I did a few contests with it as the second radio while the first radio was the FT-1000MP.

I could hear anything on the little rig that I could hear on the big rig so I guess it's "battle test" did OK! (They were on different antennas so there was always a difference in RX sig's as expected).

No problem has been seen with BC interferance here in NV, ID or AZ, which are the three states I've operated from.

One question I have....when compairing the two radios, did you have the same filters in use?

If so, I'd send the rig in and get it checked out.

Hope this helps,

From: Bob Evans
Topic: 4673 Message: 4673

Guys,

I see a number of you mentioning poor receive signals and high SWR and I've got another clue that may help. Yesterday, a local friend of mine complained of exactly the same thing. We got together at lunch and looked at his system. He had a COMET mount/coax assembly that he purchased new, just like I had done. His ATAS-100 was not tuning reliably and his receive sigs were way down. The reason is that COMET (and probably other manufacturers) don't solder the coax to the antenna mount. The shield is mechanically (poorly, in my opinion) jammed into the mount. Here in Texas with our high humidity, oxidation occurs rapidly and loss of coax shield to the antenna causes improper tuning which yield low signal level and high SWR readings. We got a solid, soldered connection to the mount and, viola, the rig works great. I had the same experience with my setup. You just NEVER expect your brand new, store-bought coax/mount not to work. Believe me, check that connection out and fix it as the first step when you see problems. It may save you days of frustration.

By the way, my friend was not aware that you could tune the ATAS-100 manually. You simply hold the mike button closed and push the UP and DOWN buttons on the front of the rig and the antenna will go UP and DOWN. By setting the MTR button to SWR, rather than ALC reading, you can tune the antenna for lowest SWR. This has worked when the shield was poor enough to impede automatic tuning, however, in my friend's case, even though we got it tuned manually, the shield connection was so bad that he could not get 100W of RF to the antenna until the shield was corrected.

Good luck

From: Monte Stark
Topic: 4659 Message: 4674

>
> Try using it in CW Mode with the 500 Hz filter selected. You'll have better
> than a 75/25 chance of finding that this has been a problem waiting for you
> to find.

One thing I'd like to mention is this.....

How a rig "sounds" is something that is hard to define from
one operator to another.

Operating full break-in is one of them.

For example, some people can't stand QSK because they need
to hear their sig being sent all alone and in the clear with
nothing else going on.

Others don't need to pay much attention to the side tone and
don't mind lots of other noise.

So when a rig has anything less than GREAT (like in many TenTec
rigs) QSK, there will be some who can't stand it and others
who don't mind it!

As an example, my FT-100 with no filters slected has GREAT
sounding QSK, but with the 500 Hz filter slected, it becomes
worse than the QSK on my FT-1000MP. Now there really isn't
anything there for anyone else to compare to, is there?

Is there some real way to test this? Trying to understand
what each person means by "loud" or "pop" gets frustrating.
That's about like trying to understand what a rig is really
doing when someone says it doesn't hear good!

There are things like 12 dB sinad tests for FM RX that can
tell you the true story on RX sesitivity.

But how can we test something like QSK and get real numbers
that can be compared?

cul,

James -

Tnx for the response. Yaesu tells me that my problem is in all FT-100s and rigs with the 300 Hz filter the "pops" of squelch is louder than with the 500. I would like know how your FT-100 does with the 500. Someone suggested that I may have had the volume (AF) to high. It didn't seem to matter with my FT-100. I'll be looking forward to your "test" results. And Txn agn.

Date: 2000-08-30 17:17:59 UTC
From: ad6ez@aol.com
Topic: 4659 Message: 4676

Ron makes a good point. If there were "numbers" that could be generated by a quantitative test it would be easy to say that any rig with less-than # is acceptable and all rigs with greater-than are not and should be repaired or adjusted. However, Yaesu agreed that the popping sounds were excessive and also agreed, after conferring with their headquarters in Japan, that they could not reduce the noise nor fix it. If the problem is best described as "a bad QSK" then it's an awful QSK! My FT-990 is very quiet working full break-in with the 500 Hz filter. I expected the same from my FT-100 or at least something close.

The problem I had with my FT-100 is that the noise generated when switching from Tx to Rx using the 500 Hz filter in full break-in mode amounted to a very annoying "echo." Just imagine sending CW and hearing a "landline" telegraph-type echo of your sidetone of each character sent! The Echo, by the way, is not a clicking sound but an instantaneous squelch noise that is best described as a pop or very close to it.

I think I've beat this horse to death. I won't bring it up again unless someone asks me about or wants to compare notes about the problem.

James, QST did a big article on the encroachment of foreign broadcast stations on 40 meters. I hear them also but usually starting early evening or late at night. Maybe the reason you don't hear the stations on your tentec and only on the FT-100 is that that the 100 has a more sensitive receiver. Hope this helps.

YES, I have the same problem and put a post up some time back about it. Even with the squ. well closed the CTCSS decoder pops all the time! My 742 sitting next to the FT100 is dead quite! The 742 opens for threshold signals, without any delay that's noticable. The loop bandwidths seem similar but the FT100 pops all the time. Sure would like CTCSS to work better. Yeasu - any comments??

Having designed tone decoders, I can tell you that a good design compares the energy in the desired band with the out of band energy. With noise being broadband, it should not fool the tone decoder if it checks the energy in both bands.

My guess is somewhere in radio design land, in the goal to make a cheaper product, a microprocessor based tone decoder has replaced the old tone decode chips. Since the uP is there anyway, it could multitask and check the PL. This would explain why some modern radios have worse CTCSS (like the VX5) than the old radios.

Anyone with a schematic for the FT100 could let us know if there is a tone decode chip.

This quest we have for miniaturization has led to smaller but inferior products. A notebook computer with the same processor speed is much slower in responding to the user than a desk top computer. The tiny HT's don't work as well as an old Moto brick radio. Filters need a certain amount of space, so I suspect the new radios don't have as much filtering, or the separation between stages is sacrificed, etc. Was the GE Mastr (sic) II the pinnacle of radio design? Remember, it temp compensated the crystal to deliver 2ppm accuracy.

This rambling leads to an interesting marketing question: If the control head can fit in a DIN slot, just how small does the radio "guts" have to be, i.e. assuming remote mounting.

Tone decode speed could be quite fast if you threw engineering at it. Ever wonder how your modern 56K modem can fall back to 300bps (i.e. go from PSK to FSK). Since you have a DSP in the modem anyway, you decode FSK by sampling the signal, computing an arcsine, then running a linear regression on the arcsine output to estimate the frequency of the signal. [We did this 15 years ago on a modem I helped design.] All the hardware is already there for the 56K function, and the trig functions are already sitting in a "coordic" algorithm. This scheme makes a much faster tone decoder than the old bandpass filter and energy detector scheme.

Thanks for the reply

Well..... Maybe I'm just spoiled. I have a TM742 with three bands where I always run the radio unsquelched and the ctcss turned on with ner a wimper of squelch noise (completely silent). Nor do I notice slow activation from the 742 with ctcss turned on. So while the logic sounds go in your message, reality appears to work otherwise for me.

Jeff :)

Topic: 4668 Message: 4683

WARNING: Contents of this message constitute a meandering off topic rant resulting from a wide range of frustrations. Furthermore, there is no intent to be critical of any individual or group other than the manufacturers in general and no critical nature other than that should be read into these writings.

Gary:
You obviously have a good deal of experience with all this, as I have in certain other areas, and perhaps scores of others on this list have in their own areas of specialty. Perhaps it would be wise for Yaesu, or whomever, to tap into this resource and let us help them design future radios. I for one would offer some of what expertise I have, probably at minimal or no cost, if I thought it would further the state of the art. What might be even better is an "open-source" approach to radio design (ala Linux) with manufacturers doing the implimentation, perhaps with minor variations (ala RedHat, SuSE, Corel, Mandrake, Slackware, ...). For example, I've long wanted radios, scanners and the like to be programmable using some kind of high level language that would actually allow you to change their behavior. I'm sure I'd be able to help with something like that. To some extent, open source development is already happening with some of the clubs and organizations doing hardware projects "in the open" (AMSAT, TAPR, ...), but just imagine what we could end up with if we took the concept to the extreme.
Since I'm diverging from the topic and the focus of the list for a second, I'll make one more point related to the progression of this technology. It seems that despite how successfull a particual trait of a radio is, it will someday be forgotten or lost in the race for new designs. How many times have you lamented that a characteristic of a prior radio isn't available in current production radios, even from the same company? My guess is that any of us who've been in this hobby for a while have seen some really good ideas get lost in the shuffle. Whouldn't it be nice if Yaesu or Icom asked us what we liked about any of their radios for the last 20 years and tried to build new ones with as much of that as possible?
Getting back to the point, I'm sure they could have put a more sophisticated PL decoder into the FT-100. However, to do what you're suggesting likely involves more than what would they would consider a reasonable tradeoff of performance vs cost and delivery. Now, getting back off the point, if they asked us what's important, I wonder how many people would consider CTCSS decode performance with an open squelch to be a high priority. Frankly, I don't think I've really ever wanted to do that and I've been all around this hobby for some 35 years.
Gary, please don't take this as being critical, I don't mean it that way. What I think would be nice though, is for everyone to consider the relavance of any particular radio function or parameter. In many cases,

and I think there's been a few examples here receintly, I think we can
honestly agree that despite some of its shortcommings (which by the way
you can find in just about any radio), the FT-100 is overall a real good
radio for the size and money and for how most people use it.
So, until we all get together to design the first perfect open-source
communications equipment, or have an open feedback channel to the
manufacturers to which they really listen, we can expect to put up with a
few annoyances now and then. Too bad, but that's the nature of the beast.

Chuck - N8DNX

Rhetoriocal question? - So, which manufacturer will be the first to
release their designs, programming and patents into the public domain and
encourage cooperative development?

I have to agree that this CTCSS squelching (with no RF squelch) is great for weak signals, The RF can fade, but if the tone is there, open up the audio.

Do you want to start an egroup call "future_radio"? If so, I'm there. I've got lots of ideas on how to make new products, but don't want to go into the radio business. ;-)

Note that the new HF radios have DSP built-in. It would not cost much at all to make a good DSP squelch. It just takes convincing the powers that be that someone will pay for it.

Sometimes products go through a cost cutting cycles where new models don't work as well as old models. This may be the deal with the CTCSS. [The HP laser printers are an example where the old one were better, especially laserjets 3 and 4.]

Jeff:
Well, I just went through a bunch of radios sitting here in the shack and I'd have to say the resuts are kind of mixed. A number of them from various manufacturers do false on open squelch. Some never seem to. I suppose a more comprehensive study might be in order to see if there's some trait that tends to be common, such as detector audio response, ultimate PL sensitivity, or whatever and to see if there's any coorelation.
One radio that did suprise me though was the FT-847, which regularly falsed with open squelch (Hmmm...). Since I didn't have the FT-100 in the shack (it's in my truck right now), I decided to put the 847 on my service monitor and do some testing. The results were pretty impressive. As long as there was any kind of signal at all (.07uv is the lowest I went -- didn't bother dragging a 20db pad out of the drawer) it never falsed. Also, the ultimate squelch sensitivity was something just under .3KHz and never changed even when I bombarded it with another audio signal of up to 8 KHz deviation at the same time and on any frequency above about 200 Hz. Through all that, it never failed to decode the PL in less than .1 seconds. If the FT-100 is anything the same, I'll take it.

Gary:
If I'm correct, the VX-5 uses something like DSP for PL decode.
Unfortunately, DSP introduces delay--no surprise to VX-5 owners.

Funny, I have my trusty old LaserJet Series II sitting here on this system. It's nearing 200,000 pages and still going (with only minor repair). Can't tell you how many other printers I've been through since I bought that thing many years ago. Kind of makes my point. Seems that HP forgot something that they had a while ago.

So, you going to create the "future_radio" list? I'll be your first member.

Topic: 1596 Message: 4688

Well I thought I would offer my experience with the radio and Yaesu customer service.

I purchased my ft-100 last Oct and installed it and an atas-100 in and on my Chevy Tahoe. My installation is in the files section. I used no special grounding for either the radio or the rig, in fact if you look at the pictures it's mounted on a wooden pedestal. I did run
the power from the battery. I did get the hi-swr a couple of times. I corrected it by powering down and then retuning. I decided to send it in before the warranty expired and get the updates and tune up done. I sent the unit out on 8/18, they received it on the 21st, I called on the 28th to ask them if they normally did a tune up, and also ask how it was coming. The tech said he would check, came back and told me it was done and had already shipped on the 25th. I received it today (30th) 3day priority, doubled boxed and in great shape(box).

I would say that was pretty good response.

While it was away I mounted my ft-847 on the same bracket and it preformed very well, but I sure did miss the size of the ft-100. By the way another good customer service experience came from Powerwerx (Ken, KM6YH) I ordered a second connector so I have a common connection between the house and car and rigs. He e-mailed me back clarifying what I needed shipped them quick mail and included an extra connector so it would be right.

Thanks Ken and Yaesu

I think we need more of the good stuff on the reflector to kind of balance it out. If I was reading the reflector and making a decision on whether to purchase an ft-100 I probably wouldn't.

I'm glad I did really enjoy it.

Subject: [FT100] 40M Performance on CW

My Groups | FT100 Main Page | Start a new group!

Several days ago I posted a question concerning lots of braodcast interference in the 40M CW band on my FT100. I am getting lots and lots of the interference, but when I listen to the same portion of the band on my TenTec Omni 6, the band is clear with no broadcast or other interference. I asked if anyone else was experiencing this type of noise.

I have not received one response to this question. Is it safe to assume that I am the only one having this problem and I should send my rig back to Yaesu, or is there a silent majority out there who don't want to say. Maybe I am the only one working 40M CW with the FT100, something I really doubt.

Anyway, I am still looking for any opinions and experience that you may have had. Still need to make a decision on repair or standing pat.

Thanks,

Jim

4692. 40m

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-31 02:57:41 UTC
From: Ignacy Misztal
Topic: 4692 Message: 4692

I compared FT-100 to TS-850 on 30m, which is the toughest band with my antenna in GA. TS-850 needs IPO to hear clearly while FT-100 needs both IPO and RF ATT to achieve a similar effect. Apparently, the dynamic range of FT-100 is lower, and the band pass filters of FT-100 are much wider than in TS-850.

Now I operate temporarily as VK2IFS using a 26 GA 50 ft wire from a window
to a tree, and using the water radiator as ground. 40m is very noisy without IPO and RF ATT but I can usually work most stations on CW. The biggest problem is RF feedback on 10 MHz (SSB in VK!) and 17m. No feedback on 14. Must be an interaction of antenna radiation and poor shielding of the microphone despite RF beeds between the FT-100 and a tuner.

Jim (K3WU), I have not written to the list before because I have not had any problems. I have a FT-100 that I recently moved to my vehicle. When I was using it at a fixed location I had the same problem you have. Since I went mobile I find I still have a problem just not as severe. I use a N7LYY screwdriver antenna on the mobile and it works very well. I don't think you have a problem, just a sensitive receiver.

4694. Comet duplexer & antenna mount

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-31 13:03:30 UTC
From: John Walker
Topic: 4694 Message: 4694

I also have a comet mount. It worked fine when I first installed it but know with the comet
CF530 in line I cannot tune 15 & 17 meters.... I take the duplexer out and it tunes fine.
Yaesu and comet both say to use braid for radio gnd and Yaesu says to take the 1"
braid and open up a loop and slide it over the uhf mount then screw down the antenna
on top of it. This did not work either. How did you go about soldering the shield to the mount it all seems enclosed tight?

73 de N1QXV
John

Guys,

I see a number of you mentioning poor receive signals and high SWR and I've got another clue that may help. Yesterday, a local friend of mine complained of exactly the same thing. We got together at lunch and looked at his system. He had a COMET mount/coax assembly that he purchased new, just like I had done. His ATAS-100 was not tuning reliably and his receive sigs were way down. The reason is that COMET (and probably other manufacturers) don't solder the coax to the antenna mount. The shield is mechanically (poorly, in my opinion) jammed into the mount. Here in Texas with our high humidity, oxidation occurs rapidly and loss of coax shield to the antenna causes improper tuning which yield low signal level and high SWR readings. We got a solid, soldered connection to the mount and, viola, the rig works great. I had the same experience with my setup. You just NEVER expect your brand new, store-bought coax/mount not to work. Believe me, check that connection out and fix it as the first step when you see problems. It may save you days of frustration.

By the way, my friend was not aware that you could tune the ATAS-100 manually. You simply hold the mike button closed and push the UP and DOWN buttons on the front of the rig and the antenna will go UP and DOWN. By setting the MTR button to SWR, rather than ALC reading, you can tune the antenna for lowest SWR. This has worked when the shield was poor enough to impede automatic tuning, however, in my friend's case, even though we got it tuned manually, the shield connection was so bad that he could not get 100W of RF to the antenna until the shield was corrected.

Good luck

Bob K5WA/M

4695. Is CT-62 REQUIRED to use CAT with the FT100?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-31 16:49:54 UTC
From: kc0fvm@arrl.net
Topic: 4695 Message: 4695

Hi,

I am curious about the CT-62 CAT control cable for the FT100.
In one bit of Yaesu literature I read that this cable has
level shifters to allow the control CPU of the FT100 to talk
to an RS-232 port. Other sources seem to suggest that even
though the BandData pigtail does not have true RS232 levels,
it will work with many computers with a proper null modem cable.

Does anyone have experience with homebrew CAT cables with the
FT100 and can describe how they did it? Are ferrites needed
or optocouplers? Is there any level shifting, protection diodes
or current limiting resistors needed?

I found it interesting that there are unused CT62 cables advertised
on the net. And the store that I bought the FT100 from neither
stocks the CT62 nor has ever sold one.

Thanks and 73,
Richard, kc0fvm

I guess we know who is on the cutting edge of technology. I bet they read our comments. I hope the cooling fans on the FT-817 are quieter than the FT-100 and D. the fans on the FT-90 are some what better and you can custom program them. Hopefully on the 817 for RX there will be no fan, just an adequate heat sink. nothing blows worse that having a fan come on when i'm trying to copy some weak signal. Difficult to see but looks like a fan shrouding on the back of the 817 to me. Any body have any comments or information?

It take a huge slab of heat sink to get rid of a fan. I don't think you can make a tiny high power radio without a fan. Even peltier's require fans to work properly since they generate heat themselves.

Does the FT100 fan come on as soon as you hit the PTT, or does it have a thermal sensor to hold off the fan until the heat sink really gets hot.

Mine does both. On high as soon as you hit PPT, and on slow
until unit cools down. (in other words, the fan is on low almost all
the time), plus add that to the fan in the switching power supply,
and the noise from my 50 gallon Salt water fish tank behind me, it
is not very quiet in the shack!

Topic: 4696 Message: 4700

On my FT-100 the fan comes on as soon as you key the mic and will stay going when you release the mic key until it cools enough to stop.
When I looked in the back of my Radio I found that none of the finals are mounted on heat sinks, this must be the reason why my fans go all the time when transmitting.

4701. FT-100 WX Sat reception

Yahoo group: FT100 (1998 — 2000)
Date: 2000-08-31 21:15:38 UTC
From: Jonathan Jesse
Topic: 4701 Message: 4701

First, the narrow FM setting is much too narrow for WX sats and the wide setting is too wide. That's not to say that you can't receive the pix though. I used my FT-100 on the narrow FM setting, a 2 meter vertical antenna 10 feet off the ground (leaning in a tree), and the WXSAT 2.5 decoding program. Results were OK but not spectacular (as expected) and I had to manually track the satellites frequency for Doppler shift. I believe the optimum band width of the receiver should be in the order of 35-40 khz. A pre-amp and better would be a big help. I tried using the Wide FM mode but the front end of the FT-100 was severely overloaded with pager interference. I have posted a Satellite pic on my web site at http://geocities.com/ws1k.rm/noaa12.bmp
I did touch up the photo a bit on brightness and contrast and it was cropped from a larger pic. The pic was a pass of NOAA 12 on August 29,2000 at 2125hrs. You can see the New England and Canadian Maritime's coast fairly well.

Hope this helps and good luck,

Wow,

I can't even tell when mine come on! Granted, mine is mounted
below the counter in the RV's bedroom plus I'm a bit hard of
hearing. But they can't be too loud!

(I can hear the fan in my computer that is sitting on the
floor).

I know that in my diesel pick up I would never hear them
no matter what.....if the engine was running! :-)

From: w7kr@sisna.com
Topic: 4704 Message: 4704

I just got my FT-100 a couple of weeks ago and am still learning the menus, however I haven't been able to find a function that allows me to adjust the sidetone volume. The volume is very low and inside the truck cab, it is hard to hear. Any ideas? Maybe I am just missing it on the menu.

Thanks,

Jerry - W7KR

Reading all the posts, it looks like Yaesu did the best job they could with the fans, i.e. there is some intelligence to how they work. The only question left would be if Yaesu designed a fail safe limit, i.e. what happens if the fan fails.

I had the FT-100 mount in the direct sunlight on a previous
installation. On a few hot summers day with the car closed and locked
the temperature became quite high on the surface of the rig. On at
least two occasions as soon as I turned the rig on I noted a high
temperature icon and the fans ran at what seemed to be high speed.
After a short time it seems to me it shut down. (I recall having to
turn the rig back on) After that I started covering the rig with a
white towel on hot summer days.
The rig is now mounted remotely under the seat and I have never seen
the high temp. icon again.
So it seems to me that even in the event of a failure of the fans there
is some kind of fail-safe that will shut down the rig if the temperature
is high enough.

From: Ignacy Misztal
Topic: 4708 Message: 4708

Sidetone is adjusted internally, after getting the cover off.

There were many stories about te origin of the High SWR icon. I have the grounding modification done, but on some bands with indoor antenna there are still oscillations. I find that they are eliminated if I put a ferrite on the power cables. One can see that these cables run very close to some coils of the PA. After the ferrite, the signal is no longer scratchy.

Mike and the group,
I have not been able to hear the fans on my FT 100 at all EXCEPT if it was mobile and backed up against something. I have to reach back and check to see if they are on. I run it on a hump mount and pull the whole unit out of the car and run it like that on the bench as well. I would guess that this might be part of the problem with some of you who have fan noise problems. I believe that there was a posting not to long ago about fan noise that ended up being a fan out of balance.

Topic: 4711 Message: 4711

For the New Guys and people looking to buy an FT 100,
Some of you have come into this reflector looking to buy an FT 100 and get some good info on what the rig is capable of. Take the problems that you see here with a grain of salt. The majority of the users are quite happy with their rigs. As most of you know you hear more about the problems then you do about how happy people are with something. Keep in that in mind as you read. Now for the GOOD STUFF!!!!!!

Menu functions are easy to get to ,read and adjust. For a newcomer to ham radio this is very important

With 300 memories Its hard to fill them up unless you are a scanner buff too.

Above average NB (noise blanker)

Excellent DSP

Compact size!!!! this rig is smaller then a Cobra 25 CB radio(for you CB'ers turning Tech) and will be all the rig you need for a long time as a first rig.

All mode capability on all bands including 2mtr/440. This is a bonus for the up and coming Techs and Generals. There is alot of SSB activity on UHF/VHF and adds another fun and exciting way to be involved in the hobby. Even with the limited amount of wattage on these bands you can have alot of fun.

Detachable face gives you alot of mounting options.

Above average audio wih the stock mic. This rig also gives you some great options with the DSP mic equalizer for adding more punch or adjusting the rig to fit your voice. This is important for busting the pile ups in your future as a ham operator for that rare DX spot or for creating your own pile up on 6 meters when the band is open and you are in a rare grid ;)

Price. This is the best value in ham radio for what you get. Even at nearly 1000.00 for a FT 100 and 1300.00 for a D model you get what amounts to one of the BANGS FOR THE BUCK!!!!!!

Guys I am here to tell you that this is one FANTASTIC rig and you will be happy with it without a doubt. If this is a first rig or as a mobile it is easy to operate and once a memory is in place its even easier. I could go on and on and would but the XYL is saying we need to go. Please feel free to drop in on us on 28.390 and give a listen

to the 2 FT 100's on that frequency, mine and WH2AAT/4's, or give me a shout if you hear me on 50.125 on 6 mtrs.
Remember you will hear 1 good comment for every 10 bad so do not let the bad turn you away from one heck of a rig. Please feel free to email me personally for more info and objective comments on the good and the bad points of the FT 100.

Hi Jerry.
The level is not a menu item. Both the sidetone and the beeps are adjusted by a pot (VR1004, in the vicinity of the speaker connector) that is only accessible with the top cover off. Digest #457 (from July) has a nice discussion of it by K5WA.
I couldn't find a setting that worked for me over my range of ambient conditions, w/wo road noise etc. So being an old tinkerer, there is now a different pot in there, and a plastic shaft runs to the outside where it's reachable.

Excellent commentary, I cud add to the "good stuff" list. I will limit my comments to these:

Have had an 847 for 2+ years and got the atas-100 back at the beginning. The antenna is still working great with my ft-100.

The ft-100 has worked very well on ssb and cw in my s-10 blazer.

What a great rig, I have had many hours of enjoyment.
